

+5.0V, ±15kV ESD-Protected, Fail-Safe, Hot-Swap, RS-485/RS-422 Transceiver

ABSOLUTE MAXIMUM RATINGS

(All voltages referenced to GND.)

Supply Voltage (VCC)	+6V
Control Input Voltage ($\overline{RE}$, DE)	-0.3V to +6V
Driver Input Voltage (DI)	-0.3V to +6V
Driver Output Voltage (A, B)	-8V to +13V
Receiver Input Voltage (A, B)	-8V to +13V
Receiver Output Voltage (RO)	-0.3V to (VCC + 0.3V)
Driver Output Current	±250mA

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)

SO (derate 5.9mW/°C above +70°C)	471mW
Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow)	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1	RO	Receiver Output. When $\overline{\text{RE}}$ is low and if $(\text{A} - \text{B}) \geq -50\text{mV}$, RO is high; if $(\text{A} - \text{B}) \leq -200\text{mV}$, RO is low.
2	$\overline{\text{RE}}$	Receiver Output Enable. Drive $\overline{\text{RE}}$ low to enable RO; RO is high impedance when $\overline{\text{RE}}$ is high. Drive $\overline{\text{RE}}$ high and DE low to enter low-power shutdown mode. $\overline{\text{RE}}$ is a hot-swap input (see the <i>Hot-Swap Capability</i> section for details).
3	DE	Driver Output Enable. Drive DE high to enable driver outputs. These outputs are high impedance when DE is low. Drive $\overline{\text{RE}}$ high and DE low to enter low-power shutdown mode. DE is a hot-swap input (see the <i>Hot-Swap Capability</i> section for details).
4	DI	Driver Input. With DE high, a low on DI forces noninverting output low and inverting output high. Similarly, a high on DI forces noninverting output high and inverting output low.
5	GND	Ground
6	A	Noninverting Receiver Input and Noninverting Driver Output
7	B	Inverting Receiver Input and Inverting Driver Output
8	VCC	Positive Supply $V_{\text{CC}} = +5.0\text{V} \pm 10\%$. Bypass V_{CC} to GND with a $0.1\mu\text{F}$ capacitor.

Hot-Swap, RS-485/RS-422 Transceiver**

Detailed Description

The MAX13085E high-speed transceiver for RS-485/RS-422 communication contains one driver and one receiver. This device features fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted, or when they are connected to a terminated transmission line with all drivers disabled (see the *Fail-Safe* section). The MAX13085E also features a hot-swap capability allowing line insertion without erroneous data transfer (see the *Hot-Swap Capability* section). The MAX13085E features reduced slew-rate drivers that minimize EMI and reduce reflections caused by improperly terminated cables, allowing error-free data transmission up to 500kbps.

The MAX13085E is a half-duplex transceiver and operates from a single +5.0V supply. Drivers are output short-circuit current limited. Thermal-shutdown circuitry protects drivers against excessive power dissipation. When activated, the thermal-shutdown circuitry places the driver outputs into a high-impedance state.

Fail-Safe

The MAX13085E guarantees a logic-high receiver output when the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled. This is done by setting the receiver input threshold between -50mV and -200mV. If the differential receiver input voltage (A - B) is greater than or equal to -50mV, RO is logic-high. If (A - B) is less than or equal to -200mV, RO is logic-low. In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to 0V by the termination. With the receiver threshold of the MAX13085E, this results in a logic-high with a 50mV minimum noise margin. Unlike previous fail-safe devices, the -50mV to -200mV threshold complies with the $\pm 200\text{mV}$ EIA/TIA-485 standard.

Hot-Swap Capability

Hot-Swap Inputs

When circuit boards are inserted into a hot or powered backplane, differential disturbances to the data bus can lead to data errors. Upon initial circuit board insertion, the data communication processor undergoes its own power-up sequence. During this period, the processor's logic-output drivers are high impedance and are unable to drive the $\overline{\text{DE}}$ and $\overline{\text{RE}}$ inputs of these devices to a defined logic level. Leakage currents up to $\pm 10\mu\text{A}$ from the high-impedance state of the processor's logic drivers could cause standard CMOS enable inputs of a transceiver to drift to an incorrect logic level.

Additionally, parasitic circuit board capacitance could cause coupling of VCC or GND to the enable inputs. Without the hot-swap capability, these factors could improperly enable the transceiver's driver or receiver.

When V_{CC} rises, an internal pulldown circuit holds $\overline{DE}$ low and $\overline{RE}$ high. After the initial power-up sequence, the pulldown circuit becomes transparent, resetting the hot-swap tolerable input.

Hot-Swap Input Circuitry

The enable inputs feature hot-swap capability. At the input there are two nMOS devices, M1 and M2 (Figure 9). When V_{CC} ramps from zero, an internal $7\mu s$ timer turns on M2 and sets the SR latch, which also turns on M1. Transistors M2, a $500\mu A$ current sink, and M1, a $100\mu A$ current sink, pull DE to GND through a $5k\Omega$ resistor. M2 is designed to pull DE to the disabled state against an external parasitic capacitance up to $100pF$ that can drive DE high. After $7\mu s$, the timer deactivates M2 while M1 remains on, holding DE low against three-state leakages that can drive DE high. M1 remains on until an external source overcomes the required input current. At this time, the SR latch resets and M1 turns off. When M1 turns off, DE reverts to a standard, high-impedance

Figure 9. Simplified Structure of the Driver Enable Pin (DE)

+5.0V, $\pm 15\text{kV}$ ESD-Protected, Fail-Safe, Hot-Swap, RS-485/RS-422 Transceiver

CMOS input. Whenever V_{CC} drops below 1V, the hot-swap input is reset.

For $\overline{RE}$ there is a complementary circuit employing two pMOS devices pulling $\overline{RE}$ to V_{CC} .

$\pm 30\text{kV}$ ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver output and receiver input of the MAX13085E have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of $\pm 15\text{kV}$ without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, the MAX13085E keeps working without latchup or damage.

ESD protection can be tested in various ways. The transmitter output and receiver input of the MAX13085E are characterized for protection to the following limits:

- $\pm 15\text{kV}$ using the Human Body Model
- $\pm 8\text{kV}$ using the Contact Discharge method specified in IEC 61000-4-2
- $\pm 15\text{kV}$ using the Air-Gap Discharge method specified in IEC 61000-4-2

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Figure 10a. Human Body ESD Test Model

Human Body Model

Figure 10a shows the Human Body Model, and Figure 10b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

IEC 61000-4-2

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment. However, it does not specifically refer to integrated circuits. The MAX13085E helps you design equipment to meet IEC 61000-4-2, without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC 61000-4-2 is higher peak current in IEC 61000-4-2 because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the Human Body Model. Figure 10c shows the IEC 61000-4-2 model, and Figure 10d shows the current waveform for IEC 61000-4-2 ESD Contact Discharge test.

Machine Model

The machine model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. The objective is to emulate the stress caused when I/O pins are contacted by handling equipment during test and assembly. Of course, all pins require this protection, not just RS-485 inputs and outputs.

Figure 10d. IEC 61000-4-2 ESD Generator Current Waveform

Applications Information

The standard RS-485 receiver input impedance is $12\text{k}\Omega$ (1-unit load), and the standard driver can drive up to 32-unit loads. The MAX13085E has a 1/8-unit load receiver input impedance ($96\text{k}\Omega$), allowing up to 256 transceivers to be connected in parallel on one communication line. Any combination of the MAX13085E, as well as other RS-485 transceivers with a total of 32-unit loads or fewer, can be connected to the line.

Reduced EMI and Reflections

The MAX13085E features reduced slew-rate drivers that minimize EMI and reduce reflections caused by improperly terminated cables, allowing error-free data transmission up to 500kbps.

Low-Power Shutdown Mode

Low-power shutdown mode is initiated by bringing both $\overline{\text{RE}}$ high and DE low. In shutdown, the devices typically draw only $2.8\mu\text{A}$ of supply current.

$\overline{\text{RE}}$ and DE can be driven simultaneously; the devices are guaranteed not to enter shutdown if $\overline{\text{RE}}$ is high and DE is low for less than 50ns. If the inputs are in this state for at least 700ns, the devices are guaranteed to enter shutdown.

Enable times t_{ZH} and t_{ZL} (see the *Switching Characteristics* section) assume the devices were not in a low-power shutdown state. Enable times $t_{\text{ZH}}(\text{SHDN})$ and $t_{\text{ZL}}(\text{SHDN})$ assume the devices were in shutdown state. It takes drivers and receivers longer to become enabled from low-power shutdown mode ($t_{\text{ZH}}(\text{SHDN})$, $t_{\text{ZL}}(\text{SHDN})$) than from driver/receiver-disable mode (t_{ZH} , t_{ZL}).

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus contention. The first, a foldback current limit on the output stage, provides immediate protection against short circuits over the whole common-mode voltage range (see the *Typical Operating Characteristics*). The second, a thermal-shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature exceeds $+175^\circ\text{C}$ (typ).

Line Length

The RS-485/RS-422 standard covers line lengths up to 4000ft. For line lengths greater than 4000ft, it may be necessary to implement a line repeater.

+5.0V, $\pm 15\text{kV}$ ESD-Protected, Fail-Safe, Hot-Swap, RS-485/RS-422 Transceiver

Figure 11. Typical Half-Duplex RS-485 Network

Typical Applications

The MAX13085E transceiver is designed for bidirectional data communications on multipoint bus transmission lines. Figure 11 shows a typical network applications circuit.

To minimize reflections, terminate the line at both ends in its characteristic impedance, and keep stub lengths off the main line as short as possible. The slew-rate-limited MAX13085E is more tolerant of imperfect termination.
