PACKAGE CODE	U5+2, U5+2A
Outline Number	21-0057
Land Pattern Number	90-0174
Thermal Resistance, Multi-Layer Board:	
Junction to Ambient (θ _{JA})	255.90°C/W
Junction to Case (θ _{JC})	81°C/W

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Detailed Description

The MAX4376/MAX4377/MAX4378 high-side current-sense amplifiers feature a 0 to +28V input common-mode range that is independent of supply voltage. This feature allows the monitoring of current out of a battery in deep discharge and also enables high-side current sensing at voltages greater than the supply voltage (V_{CC}).

The MAX4376/MAX4377/MAX4378 operate as follows: current from the source flows through R_{SENSE} to the load (Figure 1). Since the internal sense amplifier's inverting input has high impedance, negligible current flows through R_{G2} (neglecting the input bias current). Therefore, the sense amplifier's inverting-input voltage equals $V_{SOURCE} - (I_{LOAD})(R_{SENSE})$.

The amplifier's open-loop gain forces its noninverting input to the same voltage as the inverting input. Therefore, the drop across R_{G1} equals $(I_{LOAD})(R_{SENSE})$. Since I_{RG1} flows through R_{G1} , $I_{RG1} = (I_{LOAD})(R_{SENSE})/R_{G1}$. The internal current mirror multiplies I_{RG1} by a current gain factor, β , to give $I_{RGD} = \beta \times I_{RG1}$. Solving $I_{RGD} = \beta \times (I_{LOAD})(R_{SENSE})/R_{G1}$.

Therefore:

$$V_{OUT} = \beta \times (R_{GD}/R_{G1})(R_{SENSE} \times I_{LOAD}) \times \text{amp gain}$$

where amp gain is 2, 5, or 10.

The part's gain equals $(\beta \times R_{GD} / R_{G1}) \times \text{amp gain}$.

Therefore:

$$V_{OUT} = (\text{GAIN})(R_{SENSE})(I_{LOAD})$$

where GAIN = 20 for MAX437_T.

GAIN = 50 for MAX437_F.

GAIN = 100 for MAX437_H.

Set the full-scale output range by selecting R_{SENSE} and the appropriate gain version of the MAX4376/ MAX4377/ MAX4378.

Applications Information

Recommended Component Values

The MAX4376/MAX4377/MAX4378 sense a wide variety of currents with different sense resistor values. Table 1 lists common resistor values for typical operation of the MAX4376/MAX4377/MAX4378.

Choosing R_{SENSE}

To measure lower currents more accurately, use a high value for R_{SENSE} . The high value develops a higher sense voltage that reduces offset voltage errors of the internal op amp.

In applications monitoring very high currents, R_{SENSE} must be able to dissipate the I^2R losses. If the resistor's rated power dissipation is exceeded, its value may drift or it may fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings.

If I_{SENSE} has a large high-frequency component, minimize the inductance of R_{SENSE} . Wire-wound resistors have the highest inductance, metal-film resistors are somewhat better, and low-inductance metal-film resistors are best suited for these applications.

Bidirectional Current-Sense Amplifier

Systems such as laptop computers and other devices that have internal charge circuitry require a precise bidirectional current-sense amplifier to monitor accurately the battery's current regardless of polarity. Figure 2 shows the MAX4377 used as a bidirectional current monitor. This is useful for implementing either smart battery packs or fuel gauges.
