

Absolute Maximum Ratings (Note 1)

Input Voltage (+V _{IN})	42V
Collector Voltage	
Logic Inputs	
Current Limit Sense Inputs	0.3V to 0.3V
Output Current (each transistor)	100mA
Reference Load Current	50mA

Note 1: Values beyond which damage may occur.

Oscillator Charging Current5mA
Operating Junction Temperature
Hermetic (J, L Packages) 150°C
Plastic (N, D Packages) 150°C
Storage Temperature Range65°C to 150°C
Lead Temperature (Soldering, 10 seconds)300°C
Pb-free / RoHS Peak Package Solder Reflow Temp (40 sec. max. exposure) 260°C (+0, -5)

Thermal Data

Note A. Junction Temperature Calculation: $T_J = T_A + (P_D \times \theta_{JA})$. Note B. The above numbers for θ_{JC} are maximums for the limiting thermal resistance of the package in a standard mounting configuration. The θ_{JA} numbers are meant to be guidelines for the thermal performance of the device/pc-board system. All of the above assume no ambient airflow.

Recommended Operating Conditions (Note 2)

Input Voltage (+V _{IN})	Oscillator Frequency Range
Current Limit Sense Common Mode Range0.3V to 0.3V Output Current (each transistor) 0 to 50mA	Operating Ambient Temperature Range SG152455°C to 125°C
Reference Load Current	SG252425°C to 85°C SG35240°C to 70°C

Note 2: Range over which the device is functional and parameter limits are guaranteed.

Electrical Characteristics

(Unless otherwise specified, these specifications apply over the operating ambient temperatures for SG1524 with -55°C \leq T_A \leq 125°C, SG2524 with -25°C \leq T_A \leq 85°C, SG3524 with 0°C \leq T_A \leq 70°C, and +V_{IN} = 20V. Low duty cycle pulse testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.)

Application Notes

OSCILLATOR

The oscillator in the SG1524 uses an external resistor R_T to establish a constant charging current into an external capacitor C_T . While this uses more current than a series-connected RC, it provides a linear ramp voltage at C_T which is used as a time-dependent reference for the PWM comparator. The charging current is equal to 3.6V/R_T , and should be restricted to between $30\mu\text{A}$ and 2mA. The equivalent range for R_T is 100k to 1.8k.

The range of values for C_T also has limits, as the discharge time of C_T determines the pulse width of the oscillator output pulse. The pulse is used (among other things) as a blanking pulse to both outputs to insure that there is no possibility of having both outputs on simultaneously during transitions. This output deadtime relationship is shown in Figure 2. A pulse width below 0.35 microseconds may cause failure of the internal flip-flop to toggle. This restricts the minimum value of C_T to 1000pF. (Note: Although the oscillator output is a convenient oscilloscope sync input, the probe capacitance will increase the pulse width and decrease the oscillator frequency slightly.) Obviously, the upper limit to the pulse width is determined by the modulation range required in the power supply at the chosen switching frequency. Practical values of C_T fall between 1000pF and 0.1µF, although successful 120 Hz oscillators have been implemented with values up to 5µF and a series surge limit resistor of 100 ohms.

The oscillator frequency is approximately $1/R_T \cdot C_T$; where R is in ohms, C is in microfarads, and the frequency is in Megahertz. For greater accuracy, the chart in Figure 3 may be used for a wide range of operating frequencies.

20 10 1 **QUTPUT DEADTIME** 2 1 0.5 0.2 .001 .002 .005 .01 .02 .05 0.1 C_T VALUE $-\mu F$

Figure 2 · Output Stage Deadtime vs. C_T

Note that for buck regulator topologies, the two outputs can be wire-ORed for an effective 0-90% duty cycle range. With this connection, the output frequency is the same as the oscillator frequency. For push-pull applications, the outputs are used separately; the flip-flop limits the duty cycle range at each output to 0-45%, and the effective switching frequency at the transformer is 1/2 the oscillator frequency.

If it is desired to synchronize the SG1524 to an external clock, a positive pulse may be applied to the clock pin. The oscillator should be programmed with $R_{\rm T}$ and $C_{\rm T}$ values that cause it to free-run at 90% of the external sync frequency. A sync pulse with a maximum logic 0 of +0.3 volts and a minimum logic 1 of +2.4 volts applied to Pin 3 will lock the oscillator to the external source. The minimum sync pulsewidth should be 200 nanoseconds, and the maximum is determined by the required deadtime. The clock pin should never be driven more negative than -0.3 volts, nor more positive than +5.0 volts. The nominal resistance to ground is 3.2k at the clock pin, $\pm 25\%$ over temperature.

If two or more SG1524's must be synchronized together, program one master unit with R_T and C_T for the desired frequency. Leave the R_T pins on the slaves open, connect the C_T pins to the C_T of the master, and connect the clock pins to the clock pin of the master. Since C_T is a high-impedance node, this sync technique works best when all devices are close together.

Figure 3 · Oscillator Frequency vs. R_T and C_T

Application Notes (Continued)

CURRENT LIMITING

The current limiting circuitry of the SG1524 is shown in Figure 4. By matching the base-emitter voltages of Q1 and Q2, and assuming a negligible voltage drop across R1:

C.L. Threshold =
$$V_{BE}(Q1) + I_1 \cdot R_2 - V_{BE}(Q2) = I_1 \cdot R_2$$

~ 200 mV

Although this circuit provides a relatively small threshold with a negligible temperature coefficient, there are some limitations to its use because of its simplicity.

The most important of these is the limited common-mode voltage range: ±0.3 volts around ground. This requires sensing in the ground or return line of the power supply. Also precautions should be taken to not turn on the parasitic substrate diode of the integrated circuit, even under transient conditions. A Schottky clamp diode at Pin 5 may be required in some configurations to achieve this.

A second factor to consider is that the response time is relatively slow. The current limit amplifier is internally compensated by R₁, C₁, and Q1, resulting in a roll-off pole at approximately 300 Hz. A third factor to consider is the bias current of the C.L. sense pins. A constant current of approximately 150µA flows out of Pin 4, and a variable current with a range of 0-150µA flows out of Pin 5. As a result, the equivalent source impedance seen by the current sense pins should be less than 50 ohms to keep the threshold error less than 5%.

Since the gain of this circuit is relatively low (42 dB), there is a transition region as the current limit amplifier takes over pulse width control from the error amplifier. For testing purposes, threshold is defined as the input voltage required to get 25% duty cycle (+2 volts at the error amplifier output) with the error amplifier signaling maximum duty cycle.

APPLICATION NOTE: If the current limit function is not used on the SG1524, the common-mode voltage range restriction requires both current sense pins to be grounded.

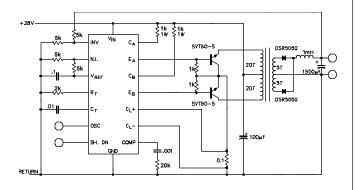

Figure 4 · Current Limiting Circuitry of the SG1524

In this conventional single-ended regulator circuit, the two outputs of the SG1524 are connected in parallel for effective 0 - 90% duty-cycle modulation. The use of an output inductor requires and R-C phase compensation network for loop stability.

Push-pull outputs are used in this transformer-coupled DC-DC regulating converter. Note that the oscillator must be set at twice the desired output frequency as the SG1524's internal flip-flop divides the frequency by 2 as it switches the PWM signal from one output to the other. Current limiting is done here in the primary so that the pulse width will be reduced should transformer saturation occur.

*RoHS compliant

Note 1. Contact factory for JAN product availablity.

- 2. All packages are viewed from the top.
- 3. Hermetic Packages J & L use Pb37/Sn63 hot solder lead finish, contact factory for availability of RoHS versions.

Package Outline Dimensions

Controlling dimensions are in inches, metric equivalents are shown for general information.

DIM	MILLIM	ETERS	INC	HES
DIN	MIN	MAX	MIN	MAX
Α	-	5.08	-	0.200
b	0.38	0.51	0.015	0.020

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense & security, aerospace and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; security technologies and scalable anti-tamper products; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif., and has approximately 3,400 employees globally. Learn more at www.microsemi.com.

Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.
