SST39LF010 / SST39LF020 / SST39LF040

SST39VF010 / SST39VF020 / SST39VF040

Data Sheet

Product Description

The SST39LF010, SST39LF020, SST39LF040 and SST39VF010, SST39VF020, SST39VF040 are 128K x8, 256K x8 and 512K x8 CMOS Multi-Purpose Flash (MPF) manufactured with SST's proprietary, high performance CMOS SuperFlash technology. The split-gate cell design and thick-oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST39LF010/020/040 devices write (Program or Erase) with a 3.0-3.6V power supply. The SST39VF010/020/040 devices write with a 2.7-3.6V power supply. The devices conform to JEDEC standard pinouts for x8 memories.

Featuring high performance Byte-Program, the SST39LF010/020/040 and SST39VF010/020/040 devices provide a maximum Byte-Program time of 20 μ sec. These devices use Toggle Bit or Data# Polling to indicate the completion of Program operation. To protect against inadvertent write, they have on-chip hardware and Software Data Protection schemes. Designed, manufactured, and tested for a wide spectrum of applications, they are offered with a guaranteed typical endurance of 100,000 cycles. Data retention is rated at greater than 100 years.

The SST39LF010/020/040 and SST39VF010/020/040 devices are suited for applications that require convenient and economical updating of program, configuration, or data memory. For all system applications, they significantly improves performance and reliability, while lowering power consumption. They inherently use less energy during Erase and Program than alternative flash technologies. The total energy consumed is a function of the applied voltage, current, and time of application. Since for any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time, the total energy consumed during any Erase or Program operation is less than alternative flash technologies. These devices also improve flexibility while lowering the cost for program, data, and configuration storage applications.

The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore the system software or hardware does not have to be modified or de-rated as is necessary with alternative flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

To meet surface mount requirements, the SST39LF010/020/040 and SST39VF010/020/040 devices are offered in 32-lead PLCC and 32-lead TSOP packages. See Figures 2 and 3 for pin assignments.

Block Diagram

Figure 1: Functional Block Diagram

Pin Assignments

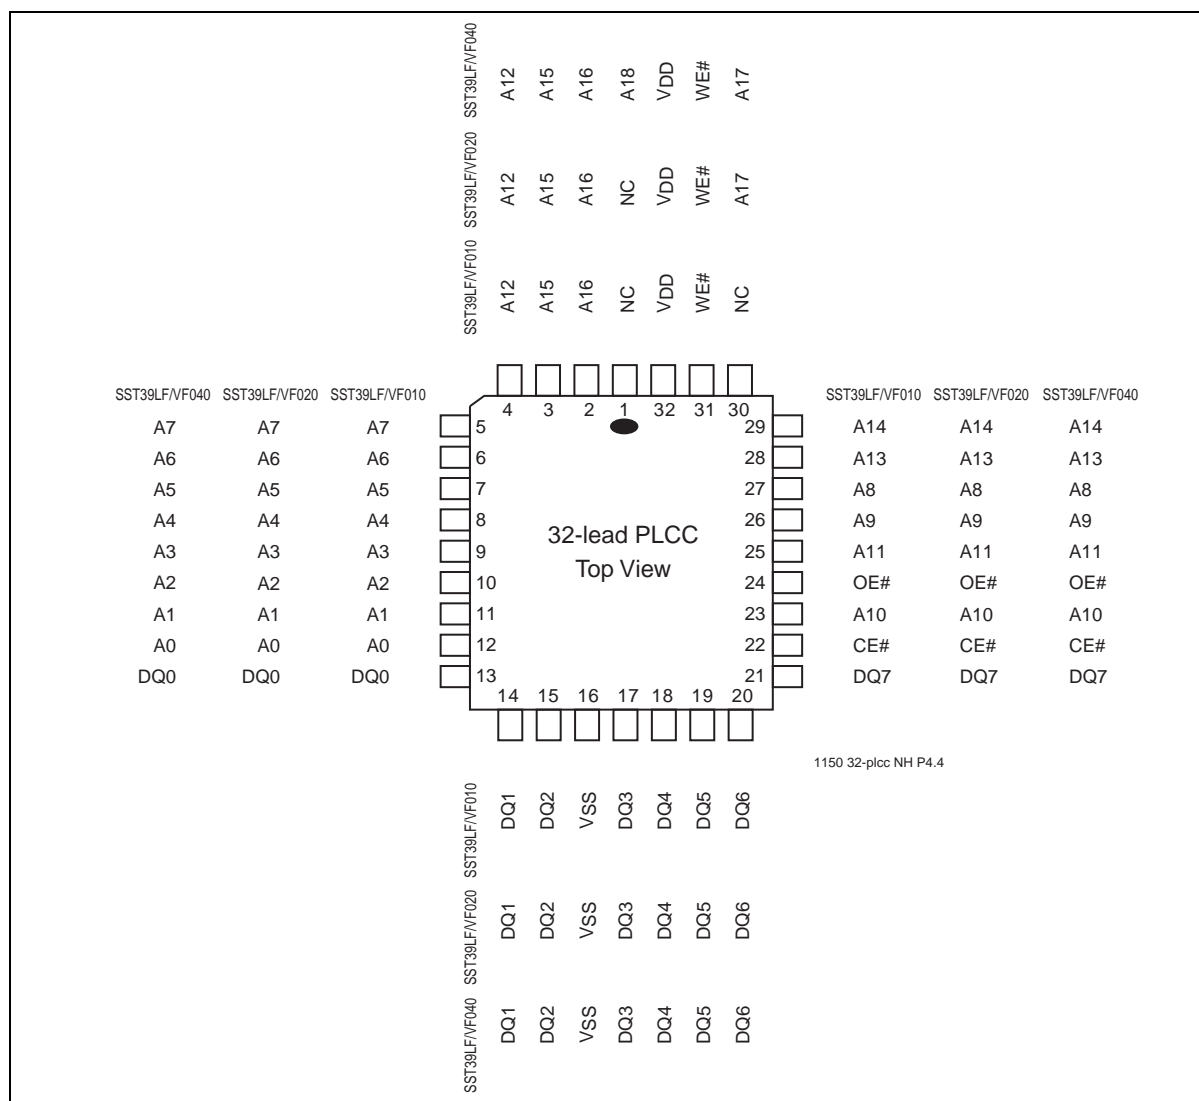

Figure 2: Pin Assignments for 32-lead PLCC

Figure 3: Pin Assignments for 32-lead TSOP (8mm x 14mm)

Table 1: Pin Description

Symbol	Pin Name	Functions
$A_{MS}^1-A_0$	Address Inputs	To provide memory addresses. During Sector-Erase $A_{MS}-A_{12}$ address lines will select the sector. During Block-Erase $A_{MS}-A_{16}$ address lines will select the block.
DQ_7-DQ_0	Data Input/output	To output data during Read cycles and receive input data during Write cycles. Data is internally latched during a Write cycle. The outputs are in tri-state when OE# or CE# is high.
CE#	Chip Enable	To activate the device when CE# is low.
OE#	Output Enable	To gate the data output buffers.
WE#	Write Enable	To control the Write operations.
V_{DD}	Power Supply	To provide power supply voltage: 3.0-3.6V for SST39LF010/020/040 2.7-3.6V for SST39VF010/020/040
V_{SS}	Ground	
NC	No Connection	Unconnected pins.

T1.1 25023

- A_{MS} = Most significant address
 A_{MS} = A_{16} for SST39LF/VF010, A_{17} for SST39LF/VF020, and A_{18} for SST39LF/VF040

Device Operation

Commands are used to initiate the memory operation functions of the device. Commands are written to the device using standard microprocessor write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

Read

The Read operation of the SST39LF010/020/040 and SST39VF010/020/040 devices are controlled by CE# and OE#, both have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either CE# or OE# is high. Refer to the Read cycle timing diagram for further details (Figure 4).

Byte-Program Operation

The SST39LF010/020/040 and SST39VF010/020/040 are programmed on a byte-by-byte basis. Before programming, the sector where the byte exists must be fully erased. The Program operation is accomplished in three steps. The first step is the three-byte load sequence for Software Data Protection. The second step is to load byte address and byte data. During the Byte-Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first. The third step is the internal Program operation which is initiated after the rising edge of the fourth WE# or CE#, whichever occurs first. The Program operation, once initiated, will be completed, within 20 μ s. See Figures 5 and 6 for WE# and CE# controlled Program operation timing diagrams and Figure 15 for flowcharts. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the host is free to perform additional tasks. Any commands written during the internal Program operation will be ignored.

Sector-Erase Operation

The Sector-Erase operation allows the system to erase the device on a sector-by-sector basis. The sector architecture is based on uniform sector size of 4 KByte. The Sector-Erase operation is initiated by executing a six-byte command sequence with Sector-Erase command (30H) and sector address (SA) in the last bus cycle. The sector address is latched on the falling edge of the sixth WE# pulse, while the command (30H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. The End-of-Erase can be determined using either Data# Polling or Toggle Bit methods. See Figure 9 for timing waveforms. Any commands written during the Sector-Erase operation will be ignored.

Chip-Erase Operation

The SST39LF010/020/040 and SST39VF010/020/040 devices provide a Chip-Erase operation, which allows the user to erase the entire memory array to the '1's state. This is useful when the entire device must be quickly erased.

The Chip-Erase operation is initiated by executing a six- byte Software Data Protection command sequence with Chip-Erase command (10H) with address 5555H in the last byte sequence. The internal Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the

internal Erase operation, the only valid read is Toggle Bit or Data# Polling. See Table 4 for the command sequence, Figure 10 for timing diagram, and Figure 18 for the flowchart. Any commands written during the Chip-Erase operation will be ignored.

Write Operation Status Detection

The SST39LF010/020/040 and SST39VF010/020/040 devices provide two software means to detect the completion of a Write (Program or Erase) cycle, in order to optimize the system write cycle time. The software detection includes two status bits: Data# Polling (DQ₇) and Toggle Bit (DQ₆). The End-of-Write detection mode is enabled after the rising edge of WE# which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Data# Polling or Toggle Bit read may be simultaneous with the completion of the Write cycle. If this occurs, the system may possibly get an erroneous result, i.e., valid data may appear to conflict with either DQ₇ or DQ₆. In order to prevent spurious rejection, if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both reads are valid, then the device has completed the Write cycle, otherwise the rejection is valid.

Data# Polling (DQ₇)

When the SST39LF010/020/040 and SST39VF010/020/040 are in the internal Program operation, any attempt to read DQ₇ will produce the complement of the true data. Once the Program operation is completed, DQ₇ will produce true data. Note that even though DQ₇ may have valid data immediately following completion of an internal Write operation, the remaining data outputs may still be invalid: valid data on the entire data bus will appear in subsequent successive Read cycles after an interval of 1 μ s. During internal Erase operation, any attempt to read DQ₇ will produce a "0". Once the internal Erase operation is completed, DQ₇ will produce a "1". The Data# Polling is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector- or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 7 for Data# Polling timing diagram and Figure 16 for a flowchart.

Toggle Bit (DQ₆)

During the internal Program or Erase operation, any consecutive attempts to read DQ₆ will produce alternating '0's and '1's, i.e., toggling between 0 and 1. When the internal Program or Erase operation is completed, the toggling will stop. The device is then ready for the next operation. The Toggle Bit is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector- or Chip-Erase, the Toggle Bit is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 8 for Toggle Bit timing diagram and Figure 16 for a flowchart.

Data Protection

The SST39LF010/020/040 and SST39VF010/020/040 provide both hardware and software features to protect nonvolatile data from inadvertent writes.

Hardware Data Protection

Noise/Glitch Protection: A WE# or CE# pulse of less than 5 ns will not initiate a Write cycle.

V_{DD} Power Up/Down Detection: The Write operation is inhibited when V_{DD} is less than 1.5V.

Write Inhibit Mode: Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

Software Data Protection (SDP)

The SST39LF010/020/040 and SST39VF010/020/040 provide the JEDEC approved Software Data Protection scheme for all data alteration operation, i.e., Program and Erase. Any Program operation requires the inclusion of a series of three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations, e.g., during the system power-up or power-down. Any Erase operation requires the inclusion of six-byte load sequence. These devices are shipped with the Software Data Protection permanently enabled. See Table 4 for the specific software command codes. During SDP command sequence, invalid commands will abort the device to read mode, within T_{RC} .

Product Identification

The Product Identification mode identifies the devices as the SST39LF/VF010, SST39LF/VF020, and SST39LF/VF040 and manufacturer as SST. This mode may be accessed by software operations. Users may use the Software Product Identification operation to identify the part (i.e., using the device ID) when using multiple manufacturers in the same socket. For details, see Table 4 for software operation, Figure 11 for the Software ID Entry and Read timing diagram, and Figure 17 for the Software ID entry command sequence flowchart.

Table 2: Product Identification

	Address	Data
Manufacturer's ID	0000H	BFH
Device ID		
SST39LF/VF010	0001H	D5H
SST39LF/VF020	0001H	D6H
SST39LF/VF040	0001H	D7H

T2.1 25023

Product Identification Mode Exit/Reset

In order to return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read operation. Please note that the Software ID Exit command is ignored during an internal Program or Erase operation. See Table 4 for software command codes, Figure 12 for timing waveform, and Figure 17 for a flowchart.

Operations

Table 3: Operation Modes Selection

Mode	CE#	OE#	WE#	DQ	Address
Read	V _{IL}	V _{IL}	V _{IH}	D _{OUT}	A _{IN}
Program	V _{IL}	V _{IH}	V _{IL}	D _{IN}	A _{IN}
Erase	V _{IL}	V _{IH}	V _{IL}	X ¹	Sector address, XXH for Chip-Erase
Standby	V _{IH}	X	X	High Z	X
Write Inhibit	X	V _{IL}	X	High Z/ D _{OUT}	X
	X	X	V _{IH}	High Z/ D _{OUT}	X
Product Identification					
Software Mode	V _{IL}	V _{IL}	V _{IH}		See Table 4

T3.4 25023

1. X can be V_{IL} or V_{IH}, but no other value.

Table 4: Software Command Sequence

Command Sequence	1st Bus Write Cycle		2nd Bus Write Cycle		3rd Bus Write Cycle		4th Bus Write Cycle		5th Bus Write Cycle		6th Bus Write Cycle

T4.2 25023

- Address format A₁₄-A₀ (Hex),
Addresses A_{MS}-A₁₅ can be V_{IL} or V_{IH}, but no other value, for the Command sequence.
A_{MS} = Most significant address
A_{MS} = A₁₆ for SST39LF/VF010, A₁₇ for SST39LF/VF020, and A₁₈ for SST39LF/VF040
- BA = Program Byte address
- SA_X for Sector-Erase; uses A_{MS}-A₁₂ address lines
- The device does not remain in Software Product ID mode if powered down.
- With A_{MS}-A₁ = 0; SST Manufacturer's ID = BFH, is read with A₀ = 0,
SST39LF/VF010 Device ID = D5H, is read with A₀ = 1,
SST39LF/VF020 Device ID = D6H, is read with A₀ = 1,
SST39LF/VF040 Device ID = D7H, is read with A₀ = 1.
- Both Software ID Exit operations are equivalent

Absolute Maximum Stress Ratings (Applied conditions greater than those listed under “Absolute Maximum Stress Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions or conditions greater than those defined in the operational sections of this data sheet is not implied. Exposure to absolute maximum stress rating conditions may affect device reliability.)

Temperature Under Bias -55°C to +125°C
Storage Temperature -65°C to +150°C
D. C. Voltage on Any Pin to Ground Potential -0.5V to $V_{DD}+0.5V$
Transient Voltage (<20 ns) on Any Pin to Ground Potential -2.0V to $V_{DD}+2.0V$
Voltage on A_9 Pin to Ground Potential -0.5V to 13.2V
Package Power Dissipation Capability ($T_a = 25^\circ\text{C}$) 1.0W
Surface Mount Solder Reflow Temperature¹ 260°C for 10 seconds
Output Short Circuit Current² 50 mA

1. Excluding certain with-Pb 32-PLCC units, all packages are 260°C capable in both non-Pb and with-Pb solder versions. Certain with-Pb 32-PLCC package types are capable of 240°C for 10 seconds; please consult the factory for the latest information.
2. Outputs shorted for no more than one second. No more than one output shorted at a time.

Table 14: Revision History

Number	Description	Date
01	• 2000 Data Book	Feb 2000
02	• Changed speed from 45 ns to 55 ns for the SST39LF020 and SST39LF040	Aug 2000
03	• 2002 Data Book: Reintroduced the 45 ns parts for the SST39LF020 and SST39LF040	Feb 2002
04	• Added the B3K package for the 2 Mbit devices • Added footnote in Table 8 to indicate I _{DD} Write is 30 mA max for Erase operations in the Industrial temperature range.	Oct 2002
05	• Changes to Table 8 on page 12 – Added footnote for MPF power usage and Typical conditions – Clarified the Test Conditions for Power Supply Current and Read parameters – Clarified I _{DD} Write to be Program and Erase – Corrected I _{DD} Program and Erase from 20 mA to 30 mA • Part number changes - see page 23 for additional information	Mar 2003
06	• Added new “MM” Micro-Package MPNs for 1M and 2M LF parts- see page 23	Oct 2003
07	• 2004 Data Book • Added non-Pb MPNs and removed footnote (See page 23) • Updated B3K and MM package diagrams	Nov 2003
08	• Added RoHS Compliant statement. • Added 4 MBit to Figure 4. • Revised Absolute Max Stress Ratings for Surface Mount Solder Reflow Temperature • Removed SST39VFxxx-90 Timing Parameters from Figure 12. • Added Footnote and removed Read Access Speed 90 = 90 to Product Ordering Information. • Removed 90 part numbers Valid Combinations lists	Dec 2005
09	• Edited page Valid Combinations on page 21. Changed 39LF040-70-4C-B3KE to 39LF040-45-4C-B3KE	Jan 2006
10	• Removed leaded parts	Nov 2008
11	• Added package YME	Feb 2009
12	• Revised “Product Ordering Information” on page 23	Apr 2009
13	• Changed endurance from 10,000 to 100,000 in Product Description, page 1	Sep 2009
14	• EOL of SST39LF010-45-4C-YME. Replacement part is SST39LF010-45-4C-MME in this document. • Removed all references to the YME package.	Jan 2010
A	• EOL of SST39LF512 and SST39VF512 parts. Replacement parts are SST39LF010 and SST39VF010. • Applied new document format. • Released document under letter revision system. • Updated spec number S71150 to DS25023.	Aug 2011
