

Pin Description

Pin Number	Pin Name	I/O ^[1]	Pin Description	Electrical Characteristics
13, 14	CLK, CLK#	I	Differential Clock Input.	LV Differential Input
35	FBIN#	I	Feedback Clock Input. Connect to FBOUT# for accessing the PLL.	Differential Input
36	FBIN	I	Feedback Clock Input. Connect to FBOUT for accessing the PLL.	
3, 5, 10, 20, 22	Y(0:4)	O	Clock Outputs	Differential Outputs
2, 6, 9, 19, 23	Y#(0:4)	O	Clock Outputs	
27, 29, 39, 44, 46	Y(9:5)	O	Clock Outputs	Differential Outputs
26, 30, 40, 43, 47	Y#(9:5)	O	Clock Outputs	
32	FBOUT	O	Feedback Clock Output. Connect to FBIN for normal operation. A bypass delay capacitor at this output will control Input Reference/Output Clocks phase relationships.	Differential Outputs
33	FBOUT#	O	Feedback Clock Output. Connect to FBIN# for normal operation. A bypass delay capacitor at this output will control Input Reference/Output Clocks phase relationships.	
37	PD#	I	Power Down# Input. When PD# is set HIGH, all Q and Q# outputs are enabled and switch at the same frequency as CLK. When set LOW, all Q and Q# outputs are disabled Hi-Z and the PLL is powered down.	
4, 11, 12, 15, 21, 28, 34, 38, 45	VDDQ		2.5V Power Supply for Output Clock Buffers.	2.5V Nominal
16	AVDD		2.5V Power Supply for PLL. When VDDA is at GND, PLL is bypassed and CLK is buffered directly to the device outputs. During disable (PD# = 0), the PLL is powered down.	2.5V Nominal
1, 7, 8, 18, 24, 25, 31, 41, 42, 48	VSS		Common Ground	0.0V Ground
17	AVSS		Analog Ground	0.0V Analog Ground

Zero-delay Buffer

When used as a zero-delay buffer the CY2SSTV857-27 will likely be in a nested clock tree application. For these applications the CY2SSTV857-27 offers a differential clock input pair as a PLL reference. The CY2SSTV857-27 then can lock onto the reference and translate with near-zero delay to low-skew outputs. For normal operation, the external feedback input, FBIN, is connected to the feedback output, FBOUT. By connecting the feedback output to the feedback input the propagation delay through the device is eliminated. The PLL works to align the output edge with the input reference edge thus producing a near-zero delay. The reference frequency affects the static phase offset of the PLL and thus the relative delay between the inputs and outputs.

Note:

1. A bypass capacitor (0.1µF) should be placed as close as possible to each positive power pin (<0.2"). If these bypass capacitors are not close to the pins, their high-frequency filtering characteristic will be cancelled by the lead inductance of the traces.

When VDDA is strapped LOW, the PLL is turned off and bypassed for test purposes.

Power Management

Output enable/disable control of the CY2SSTV857-27 allows the user to implement power management schemes into the design. Outputs are three-stated/disabled when PD# is asserted low (see *Table 1*).

Absolute Maximum Conditions^[2]

Input Voltage Relative to V_{SS} : $V_{SS} - 0.3V$
 Input Voltage Relative to V_{DDQ} or AV_{DD} : $V_{DDQ} + 0.3V$
 Storage Temperature: $-65^{\circ}C$ to $+150^{\circ}C$
 Operating Temperature: $0^{\circ}C$ to $+85^{\circ}C$
 Maximum Power Supply: $3.5V$

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, V_{in} and V_{out} should be constrained to the range:

$$V_{SS} < (V_{in} \text{ or } V_{out}) < V_{DDQ}$$

Unused inputs must always be tied to an appropriate logic voltage level (either V_{SS} or V_{DDQ}).

Notes:

- Multiple Supplies:** The Voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.
- Unused inputs must be held HIGH or LOW to prevent them from floating.
- Differential input signal voltage specifies the differential voltage $V_{TR} - V_{CP}$ required for switching, where V_{TR} is the true input level and V_{CP} is the complementary input level. See Figure 6.
- Differential cross-point input voltage is expected to track V_{DDQ} and is the voltage at which the differential signal must be crossing.
- For load conditions see Figure 6.
- The value of V_{OC} is expected to be $(V_{TR} + V_{CP})/2$. In case of each clock directly terminated by a 120 Ω resistor. See Figure 6.
- All outputs switching load with 14 pF in 60 Ω environment. See Figure 6.
- Parameters are guaranteed by design and characterization. Not 100% tested in production.
- PLL is capable of meeting the specified parameters while supporting SSC synthesizers with modulation frequency between 30kHz and 50 kHz with a down spread or -0.5%.
- While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: duty cycle = t_{WH}/t_C , where the cycle time(t_C) decreases as the frequency goes up.
