■ DESCRIPTION

The MB95120MB series is general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers contain a variety of peripheral functions.

Note : F²MC is the abbreviation of FUJITSU Flexible Microcontroller.

■ FEATURE

- F²MC-8FX CPU core
  Instruction set optimized for controllers
  - Multiplication and division instructions
  - 16-bit arithmetic operations
  - Bit test branch instruction
  - Bit manipulation instructions etc.
- Clock
  - Main clock
  - Main PLL clock
  - Sub clock
  - Sub PLL clock
- Timer
  - 8/16-bit compound timer × 2 channels
    - Can be used to interval timer, PWC timer, PWM timer and input capture.
  - 16-bit reload timer × 1 channel
  - 8/16-bit PPG × 2 channels
  - 16-bit PPG × 2 channels

  - Timebase timer × 1 channel
  - Watch prescaler × 1 channel
- LIN-UART × 1 channel
  - LIN function, clock asynchronous (UART) or clock synchronous (SIO) serial data transfer capable
  - Full duplex double buffer
- UART/SIO × 1 channel
  - Clock asynchronous (UART) or clock synchronous (SIO) serial data transfer capable
  - Full duplex double buffer
- I^2C × 1 channel
  - Built-in wake-up function
- External interrupt × 12 channels
  - Interrupt by edge detection (rising, falling, or both edges can be selected)
  - Can be used to recover from low-power consumption (standby) modes.
- 8/10-bit A/D converter × 12 channels
  - 8-bit or 10-bit resolution can be selected
- LCD controller (LCDC)
  - 40 SEG × 4 COM (Max 160 pixels)
  - With blinking function
- Low-power consumption (standby) mode
  - Stop mode
  - Sleep mode
  - Watch mode
  - Timebase timer mode
- I/O port
  - The number of maximum ports : Max 87
  - Port configuration
    - General-purpose I/O ports (N-ch open drain) : 2 ports
    - General-purpose I/O ports (CMOS) : 85 ports
- Programmable input voltage levels of port
  Automotive input level / CMOS input level / hysteresis input level
- Dual operation Flash memory
  - Erase/write and read can be executed in the different bank (Upper Bank/Lower Bank) at the same time.
- Flash memory security function
  Protects the content of Flash memory (Flash memory device only)

■ DIFFERENCES AMONG PRODUCTS AND NOTES ON SELECTING PRODUCTS

- Notes on Using Evaluation Products

  The Evaluation product has not only the functions of the MB95120MB series but also those of other products to support software development for multiple series and models of the F²MC-8FX family. The I/O addresses for peripheral resources not used by the MB95120MB series are therefore access-barred. Read/write access to these access-barred addresses may cause peripheral resources supposed to be unused to operate, resulting in unexpected malfunctions of hardware or software.

  Particularly, do not use word access to odd numbered byte address in the prohibited areas (If these access are used, the address may be read or written unexpectedly).

  Also, as the read values of prohibited addresses on the evaluation product are different to the values on the Flash memory and MASK ROM products, do not use these values in the program.

  The Evaluation product do not support the functions of some bits in single-byte registers. Read/write access to these bits does not cause hardware malfunctions. Since the Evaluation, Flash memory product, and MASK ROM product are designed to behave completely the same way in terms of hardware and software.

- Difference of Memory Spaces

  If the amount of memory on the Evaluation product is different from that of the Flash memory product or MASK ROM product, carefully check the difference in the amount of memory from the model to be actually used when developing software.

  For details of memory space, refer to “■ CPU CORE”.

- Current Consumption
  - The current consumption of Flash memory product is typically greater than for MASK ROM product.
  - For details of current consumption, refer to “■ ELECTRICAL CHARACTERISTICS”.

- Package

  For details of information on each package, refer to “■ PACKAGES AND CORRESPONDING PRODUCTS” and “■ PACKAGE DIMENSIONS”.

- Operating voltage

  The operating voltage are different between the Evaluation, Flash memory products, and MASK ROM product.

  For details of operating voltage, refer to “■ ELECTRICAL CHARACTERISTICS”.

■ HANDLING DEVICES

• Preventing Latch-up

Care must be taken to ensure that maximum voltage ratings are not exceeded when they are used.

Latch-up may occur on CMOS ICs if voltage higher than V_{CC} or lower than V_{SS} is applied to input and output pins other than medium- and high-withstand voltage pins or if higher than the rating voltage is applied between V_{CC} pin and V_{SS} pin.

When latch-up occurs, power supply current increases rapidly and might thermally damage elements.

Also, take care to prevent the analog power supply voltage (AV_{CC} , AVR) and analog input voltage from exceeding the digital power supply voltage (V_{CC}) when the analog system power supply is turned on or off.

• Stable Supply Voltage

Supply voltage should be stabilized.

A sudden change in power-supply voltage may cause a malfunction even within the guaranteed operating range of the V_{CC} power-supply voltage.

For stabilization, in principle, keep the variation in V_{CC} ripple (p-p value) in a commercial frequency range (50/60 Hz) not to exceed 10% of the standard V_{CC} value and suppress the voltage variation so that the transient variation rate does not exceed 0.1 V/ms during a momentary change such as when the power supply is switched.

• Precautions for Use of External Clock

Even when an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from sub clock mode or stop mode.

• Serial communication

There is a possibility to receive wrong data due to noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider receiving of wrong data when designing the system. For example apply a checksum and retransmit the data if an error occurs.

PIN CONNECTION

• Treatment of Unused Pin

Leaving unused input pins unconnected can cause abnormal operation or latch-up, leaving to permanent damage.

Unused input pins should always be pulled up or down through resistance of at least 2 kΩ. Any unused input/output pins may be set to output mode and left open, or set to input mode and treated the same as unused input pins. If there is unused output pin, make it open.

• Treatment of Power Supply Pins on A/D Converter

Connect to be $AV_{CC} = V_{CC}$ and $AV_{SS} = AVR = V_{SS}$ even if the A/D converter is not in use.

Noise riding on the AV_{CC} pin may cause accuracy degradation. So, connect approx. 0.1 µF ceramic capacitor as a bypass capacitor between AV_{CC} and AV_{SS} pins in the vicinity of this device.

• Power Supply Pins

In products with multiple V_{CC} or V_{SS} pins, the pins of the same potential are internally connected in the device to avoid abnormal operations including latch-up. However, you must connect the pins to external power supply and a ground line to lower the electro-magnetic emission level, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with the V_{CC} and V_{SS} pins of this device at the low impedance.

It is also advisable to connect a ceramic bypass capacitor of approximately 0.1 µF between V_{CC} and V_{SS} near this device.

• Mode Pin (MOD)

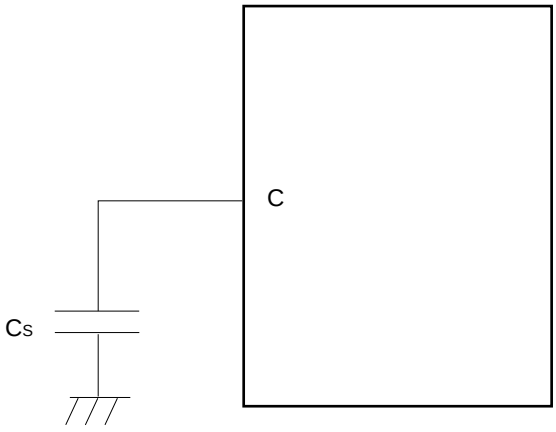
Connect the MOD pin directly to V_{CC} or V_{SS} pins.

To prevent the device unintentionally entering test mode due to noise, lay out the printed circuit board so as to minimize the distance from the MOD pins to V_{CC} or V_{SS} pins and to provide a low-impedance connection.

• C Pin

Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. A bypass capacitor of V_{CC} pin must have a capacitance value higher than C_S. For connection of smoothing capacitor C_S, refer to the diagram below.

• C pin connection diagram



• Analog Power Supply

Always set the same potential to AV_{CC} and V_{CC} pins. When $V_{CC} > AV_{CC}$, the current may flow through the AN00 to AN11 pins.

■ PROGRAMMING FLASH MEMORY MICROCONTROLLERS USING PARALLEL PROGRAMMER

- **Supported Parallel Programmers and Adapters**

The following table lists supported parallel programmers and adapters.

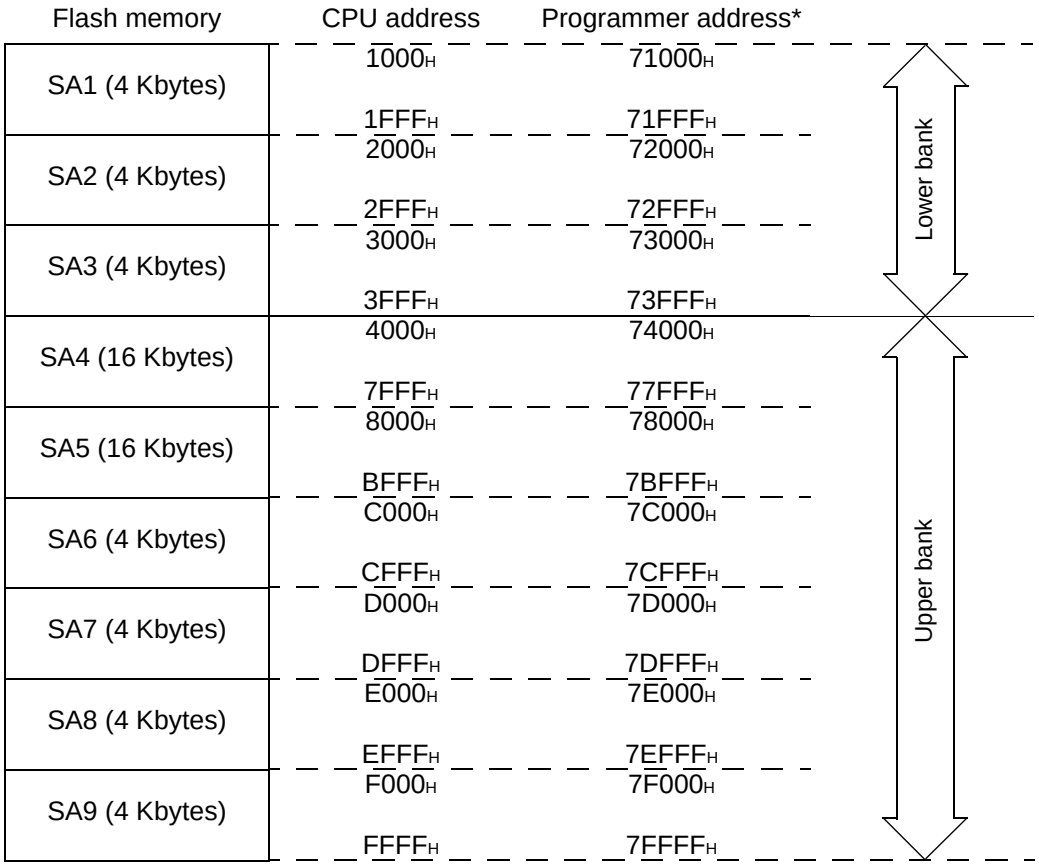
Flash Support Group, Inc. TEL: +81-53-428-8380

- **Sector Configuration**

The individual sectors of Flash memory correspond to addresses used for CPU access and programming by the parallel programmer as follows:

- MB95F128MB/F128NB/F128JB (60 Kbytes)



*: Programmer addresses are corresponding to CPU addresses, used when the parallel programmer programs data into Flash memory.
These programmer addresses are used for the parallel programmer to program or erase data in Flash memory.

- **Programming Method**

1) Set the type code of the parallel programmer to 17222.

2) Load program data to programmer addresses 71000H to 7FFFFH.

3) Programmed by parallel programmer

*: Programmer addresses are corresponding to CPU addresses, used when the parallel programmer programs data into Flash memory.
These programmer addresses are used for the parallel programmer to program or erase data in Flash memory.

• **Programming Method**

1) Set the type code of the parallel programmer to 17222.

2) Load program data to programmer addresses $7C000_H$ to $7FFFF_H$.

3) Programmed by parallel programmer

1. Memory space

Memory space of the MB95120MB series is 64 Kbytes and consists of I/O area, data area, and program area. The memory space includes special - purpose areas such as the general - purpose registers and vector table. Memory map of the MB95120MB series is shown below.

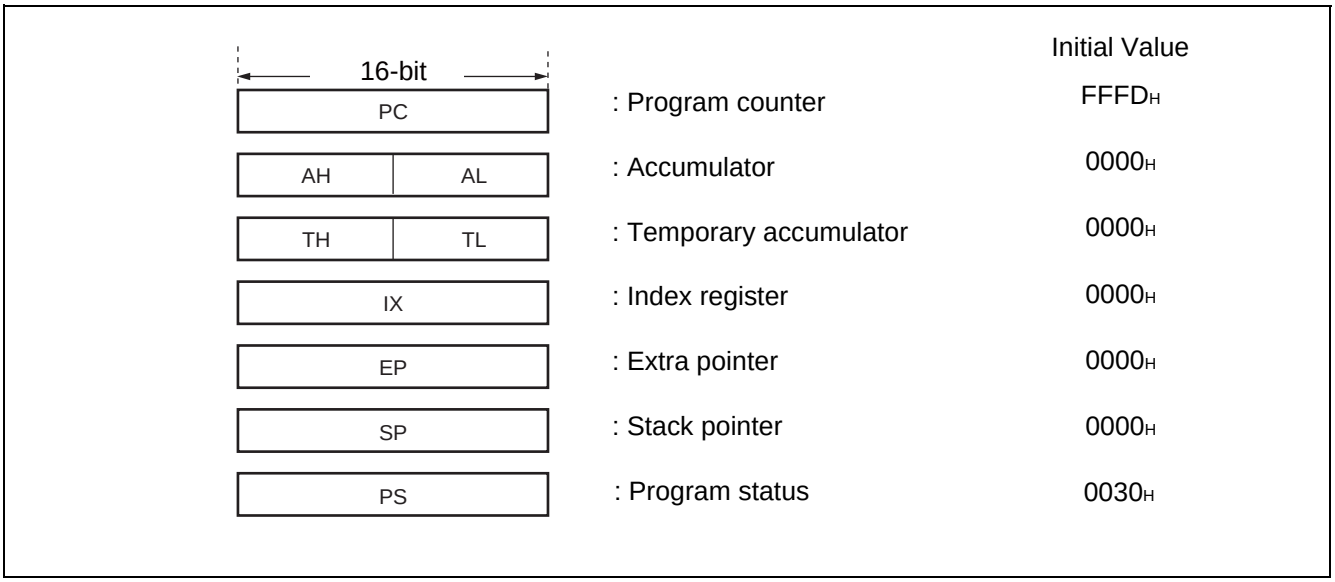
• Memory Map

	Flash memory	RAM	Address #1	Address #2
MB95F124MB	16 Kbytes	512 bytes	0280H	C000H
MB95F124NB				
MB95F124JB				
MB95F126MB	32 Kbytes	1 Kbyte	0480H	8000H
MB95F126NB				
MB95F126JB				
MB95F128MB	60 Kbytes	2 Kbytes	0880H	1000H
MB95F128NB				
MB95F128JB				

2. Register

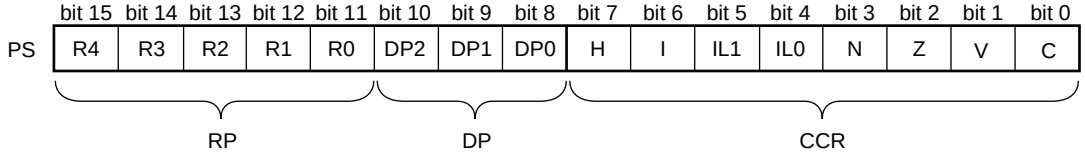
The MB95120MB series has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The dedicated registers are as follows:

Program counter (PC)	:	A 16-bit register to indicate locations where instructions are stored.
Accumulator (A)	:	A 16-bit register for temporary storage of arithmetic operations. In the case of an 8-bit data processing instruction, the lower 1 byte is used.
Temporary accumulator (T)	:	A 16-bit register which performs arithmetic operations with the accumulator. In the case of an 8-bit data processing instruction, the lower 1 byte is used.
Index register (IX)	:	A 16-bit register for index modification
Extra pointer (EP)	:	A 16-bit pointer to point to a memory address.
Stack pointer (SP)	:	A 16-bit register to indicate a stack area.
Program status (PS)	:	A 16-bit register for storing a register bank pointer, a direct bank pointer, and a condition code register



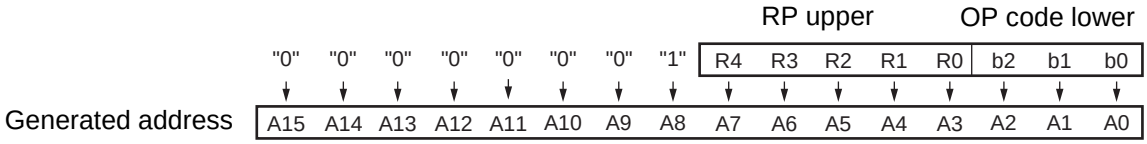
The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and a direct bank pointer (DP) and the lower 8 bits for use as a condition code register (CCR) . (Refer to the diagram below.)

• Structure of the program status



The RP indicates the address of the register bank currently being used. The relationship between the content of RP and the real address conforms to the conversion rule illustrated below:

- Rule for Conversion of Actual Addresses in the General-purpose Register Area



The DP specifies the area for mapping instructions (16 different instructions such as MOV A, dir) using direct addresses to 0080_H to $00FF_H$.

Direct bank pointer (DP2 to DP0)	Specified address area	Mapping area
XXX_B (no effect to mapping)	0000_H to $007F_H$	0000_H to $007F_H$ (without mapping)
000_B (initial value)	0080_H to $00FF_H$	0080_H to $00FF_H$ (without mapping)
001_B		0100_H to $017F_H$
010_B		0180_H to $01FF_H$
011_B		0200_H to $027F_H$
100_B		0280_H to $02FF_H$
101_B		0300_H to $037F_H$
110_B		0380_H to $03FF_H$
111_B		0400_H to $047F_H$

The CCR consists of the bits indicating arithmetic operation results or transfer data contents and the bits that control CPU operations at interrupt.

H flag : Set to “1” when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared to “0” otherwise. This flag is for decimal adjustment instructions.

I flag : Interrupt is enabled when this flag is set to “1”. Interrupt is disabled when this flag is set to “0”. The flag is cleared to “0” when reset.

IL1, IL0 : Indicates the level of the interrupt currently enabled. Processes an interrupt only if its request level is higher than the value indicated by these bits.

IL1	IL0	Interrupt level	Priority
0	0	0	High
0	1	1	↕
1	0	2	↕
1	1	3	Low (no interruption)

N flag : Set to “1” if the MSB is set to “1” as the result of an arithmetic operation. Cleared to “0” when the bit is set to “0”.

Z flag : Set to “1” when an arithmetic operation results in “0”. Cleared to “0” otherwise.

V flag : Set to “1” if the complement on 2 overflows as a result of an arithmetic operation. Cleared to “0” otherwise.

C flag : Set to “1” when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared to “0” otherwise. Set to the shift-out value in the case of a shift instruction.

The following general-purpose registers are provided:

General-purpose registers: 8-bit data storage registers

The general-purpose registers are 8 bits and located in the register banks on the memory. 1-bank contains 8 registers. Up to a total of 32 banks can be used on the MB95120MB series. The bank currently in use is indicated by the register bank pointer (RP).8-register. Up to a total of 32 banks can be used on the MB95120MB series. The bank currently in use is specified by the register bank pointer (RP), and the lower 3 bits of OP code indicates the general-purpose register 0 (R0) to general-purpose register 7 (R7).

Power consumption	Pd	—	320	mW	
Operating temperature	T_A	− 40	+ 105	°C	
Storage temperature	Tstg	− 55	+ 150	°C	

*1 : The parameter is based on $AV_{SS} = V_{SS} = 0.0$ V.

*2 : Apply equal potential to AVcc and Vcc. AVR should not exceed AVcc + 0.3 V.

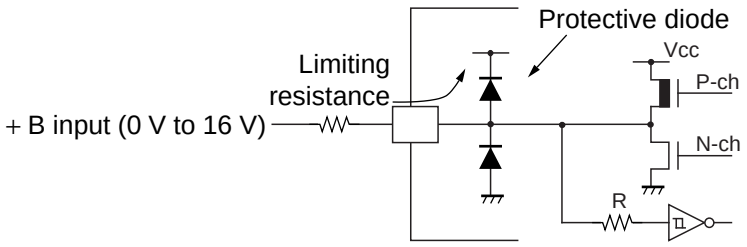
*3 : V0 to V3 should not exceed V_{CC} + 0.3 V.

*4 : V_I and Vo should not exceed V_{CC} + 0.3 V. V_I must not exceed the rating voltage. However, if the maximum current to/from an input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating.

*5 : Applicable to pins : P00 to P07, P10 to P14, P20 to P24, P30 to P37, P40 to P43, P52, P53

- Use within recommended operating conditions.
- Use at DC voltage (current).
- +B signal is an input signal that exceeds V_{CC} voltage. The + B signal should always be applied a limiting resistance placed between the + B signal and the microcontroller.
- The value of the limiting resistance should be set so that when the + B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V_{CC} pin, and this affects other devices.
- Note that if the + B signal is inputted when the microcontroller power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the + B input is applied during power-on, the power supply is provided from the pins and the resulting power supply voltage may not be sufficient to operate the power-on reset.
- Care must be taken not to leave the + B input pin open.
- Note that analog system input/output pins other than the A/D input pins (LCD drive pins, etc.) cannot accept +B signal input.
- Sample recommended circuits :

• Input/Output Equivalent circuits



WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

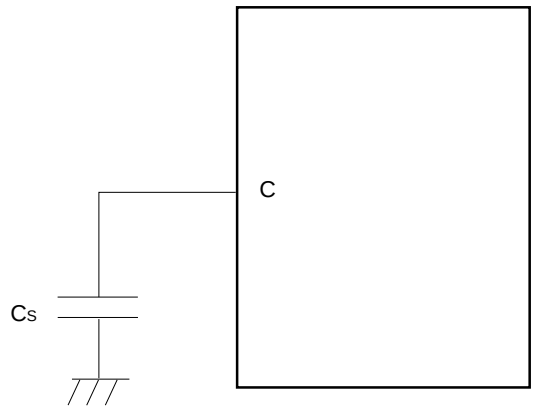
*1 : The values vary with the operating frequency, machine clock or analog guarantee range.

*2 : When the low voltage detection reset is used, reset occurs while the low voltage is detected. For details on Low voltage detection, see "(9) Low Voltage Detection" in "4. AC Characteristics".

*3 : Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. A bypass capacitor of V_{CC} pin must have a capacitor value higher than C_S. For connection of smoothing capacitor C_S, refer to the diagram below.

• C pin connection diagram



WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

- The power-supply current is determined by the external clock. When both low voltage detection option and clock supervisor are selected, the power-supply current will be a value of adding current consumption of the low voltage detection circuit (I_{LVD}) and current consumption of built-in CR oscillator (I_{CSV}) to the specified value.

(2) Notes on Using A/D Converter

- **About the external impedance of analog input and its sampling time**

A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision. Therefore to satisfy the A/D conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. Also, if the sampling time cannot be sufficient, connect a capacitor of about 0.1 µF to the analog input pin.

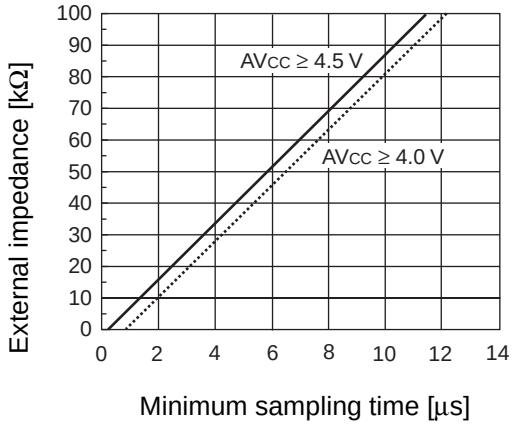
- Analog input equivalent circuit

	R	C
4.5 V ≤ AVcc ≤ 5.5 V	2.0 kΩ (Max)	16 pF (Max)
4.0 V ≤ AVcc < 4.5 V	8.2 kΩ (Max)	16 pF (Max)

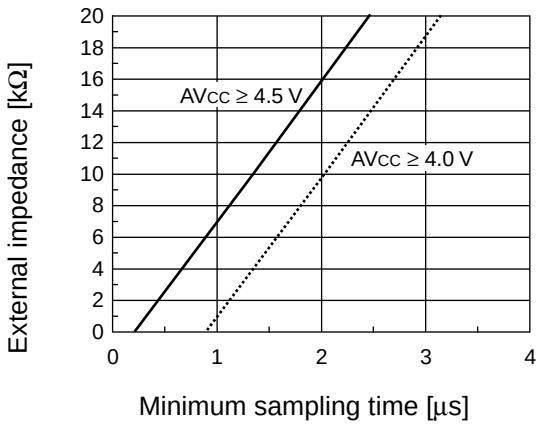
Note : The values are reference values.

- The relationship between external impedance and minimum sampling time

(External impedance = 0 kΩ to 100 kΩ)



(External impedance = 0 kΩ to 20 kΩ)

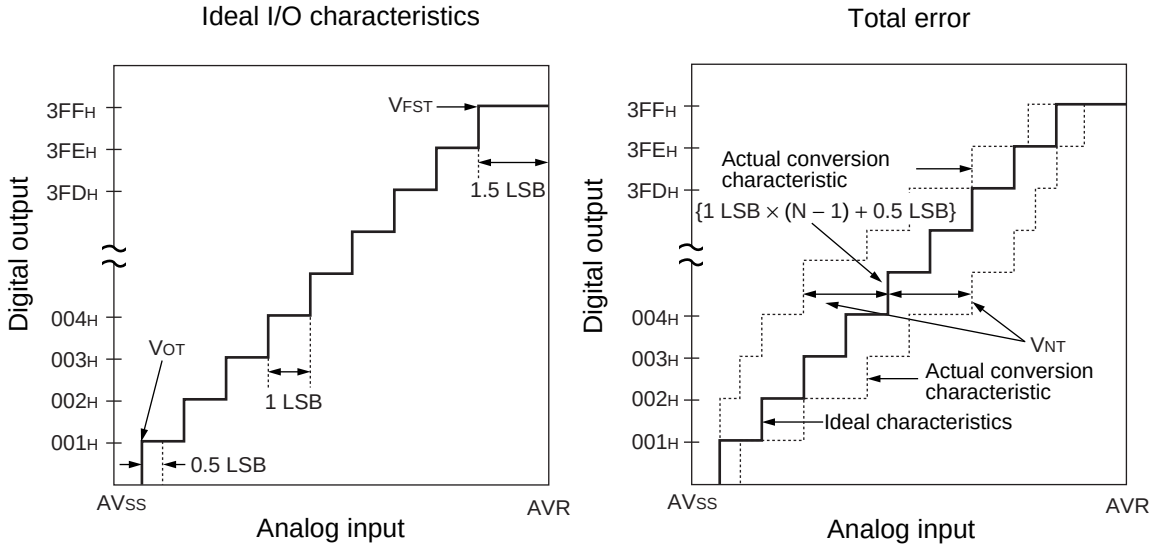


- **About errors**

As |AVcc – AVss| becomes smaller, values of relative errors grow larger.

(3) Definition of A/D Converter Terms

- Resolution
  The level of analog variation that can be distinguished by the A/D converter.
  When the number of bits is 10, analog voltage can be divided into $2^{10} = 1024$.
- Linearity error (unit : LSB)
  The deviation between the value along a straight line connecting the zero transition point
  (“00 0000 0000” ← → “00 0000 0001”) of a device and the full-scale transition point
  (“11 1111 1111” ← → “11 1111 1110”) compared with the actual conversion values obtained.
- Differential linear error (Unit : LSB)
  Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
- Total error (unit: LSB)
  Difference between actual and theoretical values, caused by a zero transition error, full-scale transition error, linearity error, quantum error, and noise.



$$1\ \text{LSB} = \frac{\text{AVR} - \text{AV}_{SS}}{1024}\ \text{(V)}$$

$$\text{Total error of digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times (N - 1) + 0.5\ \text{LSB}\}}{1\ \text{LSB}}\ \text{[LSB]}$$

N : A/D converter digital output value
V_{NT} : A voltage at which digital output transits from $(N - 1)_H$ to N_H.

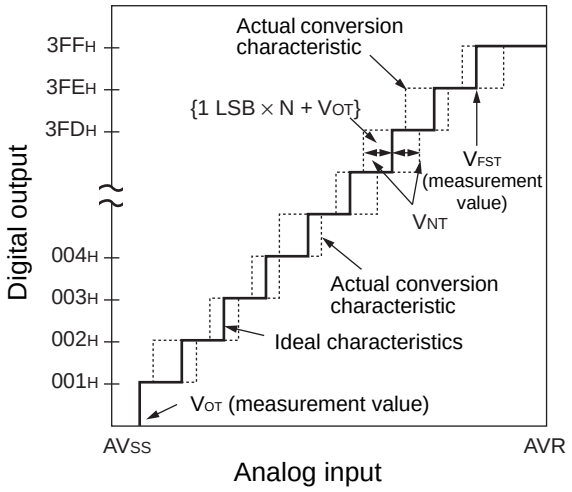
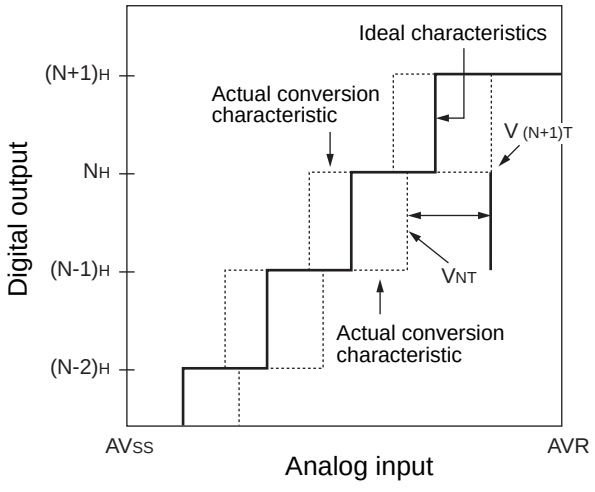
Linearity error



Differential linear error



$$\text{Linear error in digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times N + V_{OT}\}}{1\ \text{LSB}}$$

$$\text{Differential linear error in digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1\ \text{LSB}} - 1$$

N : A/D Converter digital output value
V_{NT} : A voltage at which digital output transits from $(N - 1)_H$ to N_H.
V_{OT} (Ideal value) = AV_{SS} + 0.5 LSB [V]
V_{FST} (Ideal value) = AVR – 1.5 LSB [V]

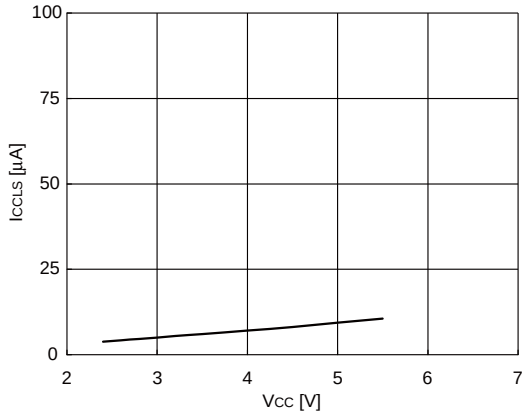
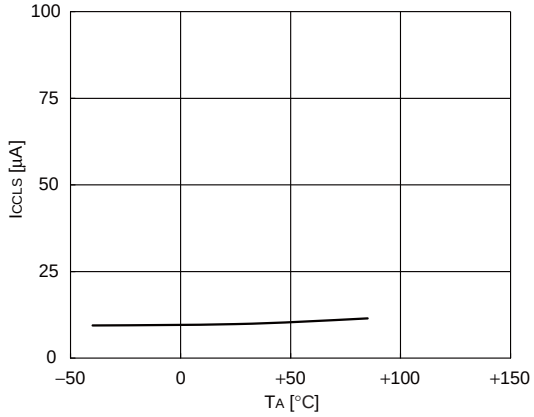
I_{CCLS} – V_{CC}

T_A = + 25 °C, F_{MPL} = 16 kHz (divided by 2)
Sub sleep mode, at external clock operating



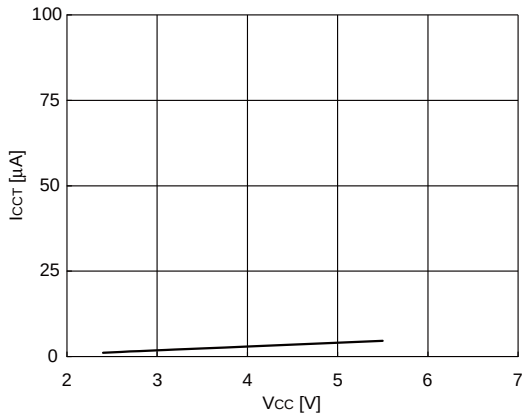
I_{CCLS} – T_A

V_{CC} = 5.5 V, F_{MPL} = 16 kHz (divided by 2)
Sub sleep mode, at external clock operating



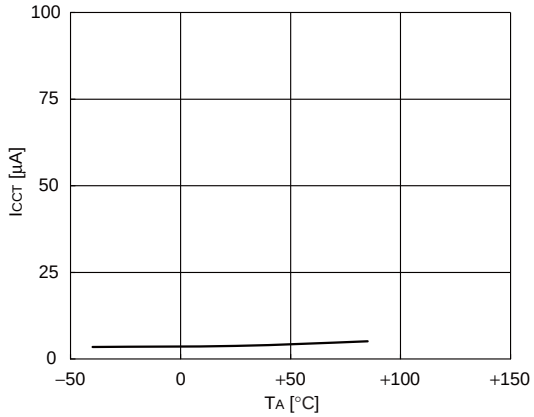
I_{CCT} – V_{CC}

T_A = + 25 °C, F_{MPL} = 16 kHz (divided by 2)
Clock mode, at external clock operating



I_{CCT} – T_A

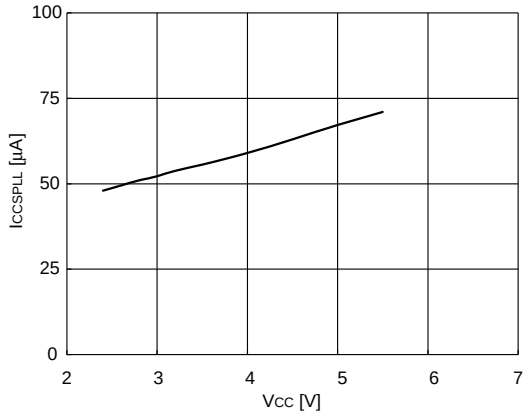
V_{CC} = 5.5 V, F_{MPL} = 16 kHz (divided by 2)
Clock mode, at external clock operating



(Continued)

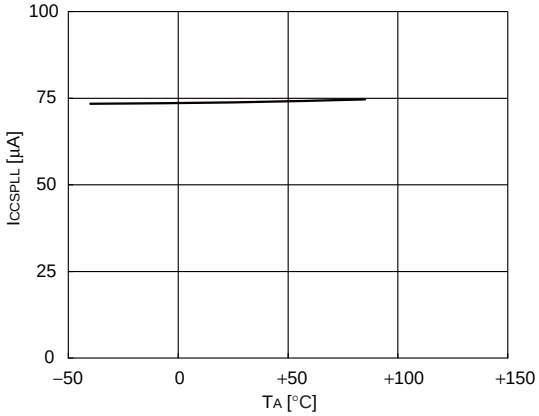
I_{CCSPLL} – V_{CC}

T_A = + 25 °C, F_{MPL} = 128 kHz (Multiply-by-4)
Sub PLL mode, at external clock operating



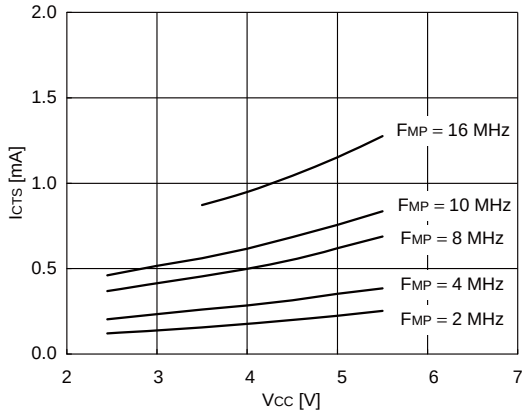
I_{CCSPLL} – T_A

V_{CC} = 5.5 V, F_{MPL} = 128 kHz (Multiply-by-4)
Sub PLL mode, at external clock operating



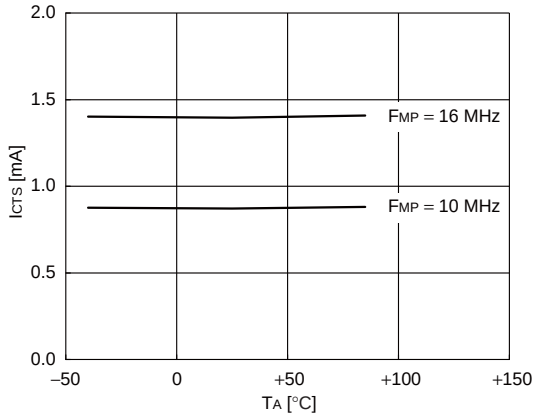
I_{CTS} – V_{CC}

T_A = + 25 °C, F_{MP} = 2, 4, 8, 10, 16 MHz (divided by 2)
Time-base timer mode, at external clock operating



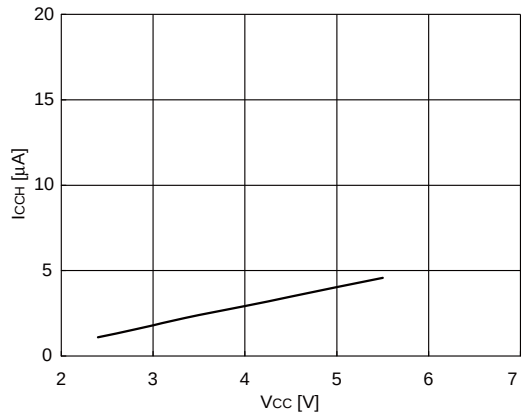
I_{CTS} – T_A

V_{CC} = 5.5 V, F_{MP} = 10, 16 MHz (divided by 2)
Time-base timer mode, at external clock operating



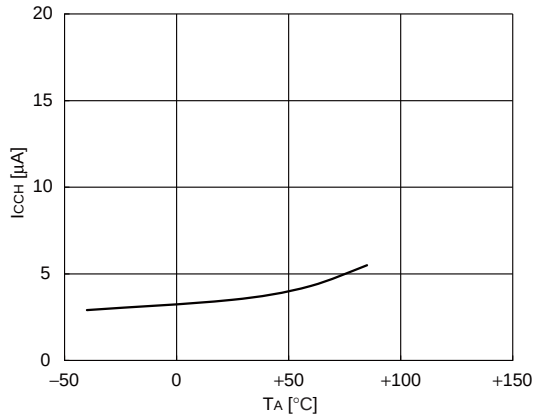
I_{CCH} – V_{CC}

T_A = + 25 °C, F_{MPL} = (stop)
Sub stop mode, at external clock stopping



I_{CCH} – T_A

V_{CC} = 5.5 V, F_{MPL} = (stop)
Sub stop mode, at external clock stopping

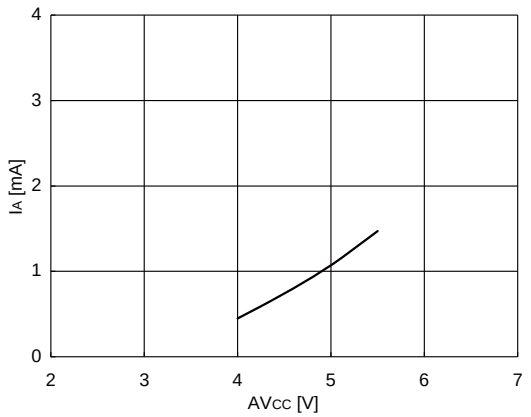


(Continued)

(Continued)

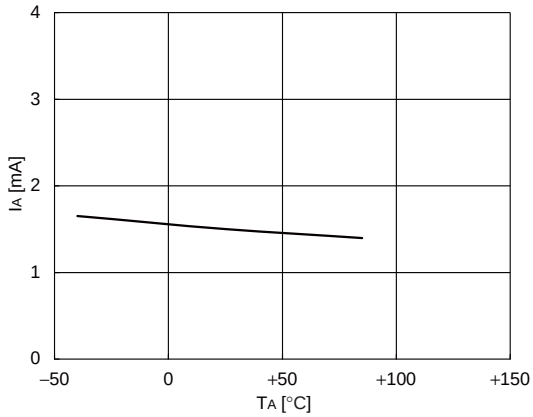
I_A – AV_{CC}

T_A = + 25 °C, F_{MP} = 16 MHz (divided by 2)
Main clock mode, at external clock operating



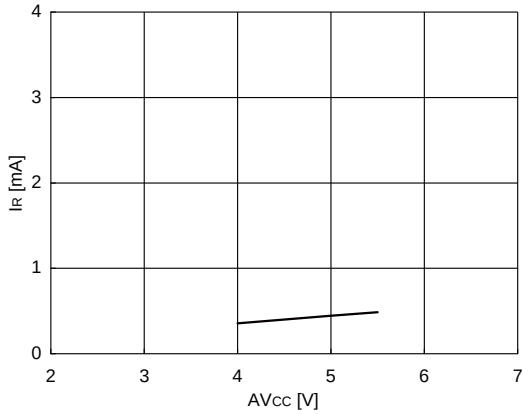
I_A – T_A

V_{CC} = 5.5 V, F_{MP} = 16 MHz (divided by 2)
Main clock mode, at external clock operating



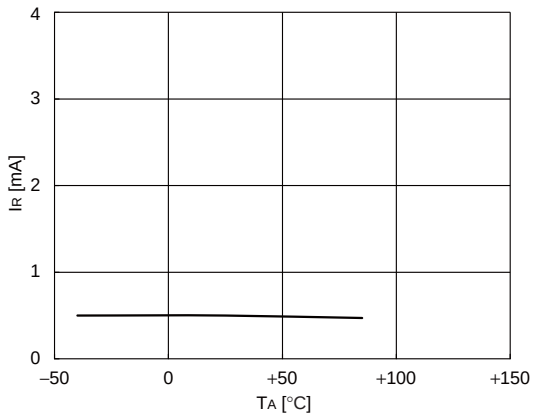
I_R – AV_{CC}

T_A = + 25 °C, F_{MP} = 16 MHz (divided by 2)
Main clock mode, at external clock operating



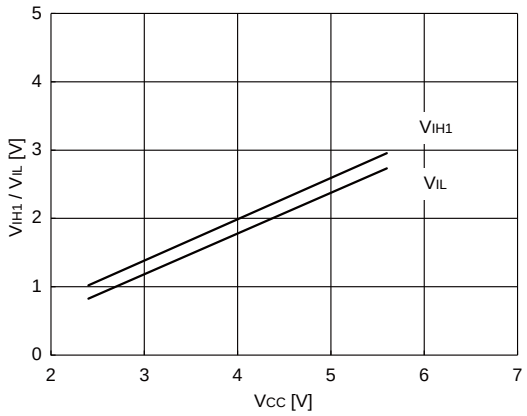
I_R – T_A

V_{CC} = 5.5 V, F_{MP} = 16 MHz (divided by 2)
Main clock mode, at external clock operating

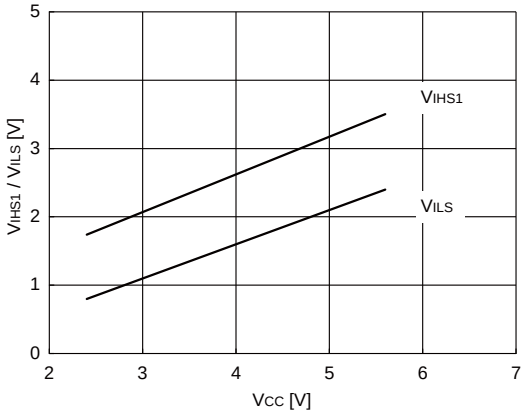


• **Input voltage**

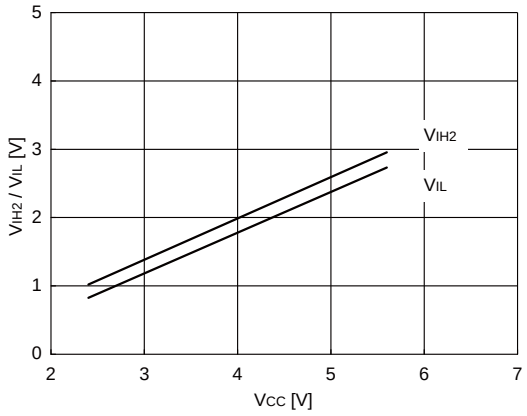
V_{IH1} – V_{CC} and V_{IL} – V_{CC}
T_A = + 25 °C



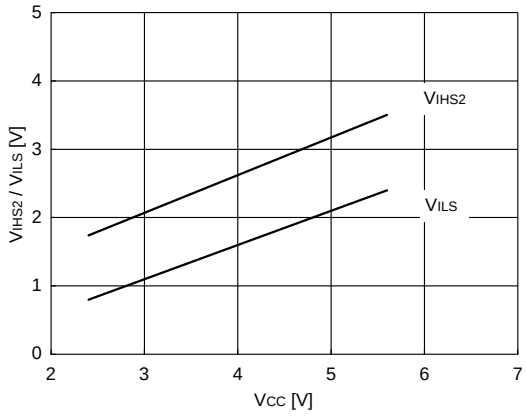
V_{IHS1} – V_{CC} and V_{ILS} – V_{CC}
T_A = + 25 °C



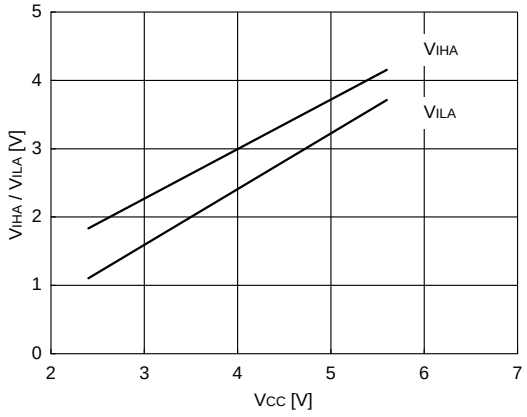
V_{IH2} – V_{CC} and V_{IL} – V_{CC}
T_A = + 25 °C



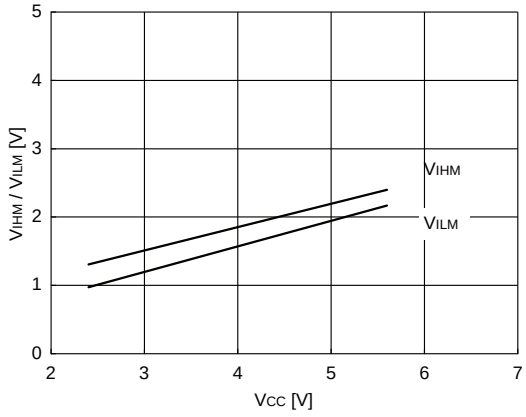
V_{IHS2} – V_{CC} and V_{ILS} – V_{CC}
T_A = + 25 °C



V_{IHA} – V_{CC} and V_{ILA} – V_{CC}
T_A = + 25 °C

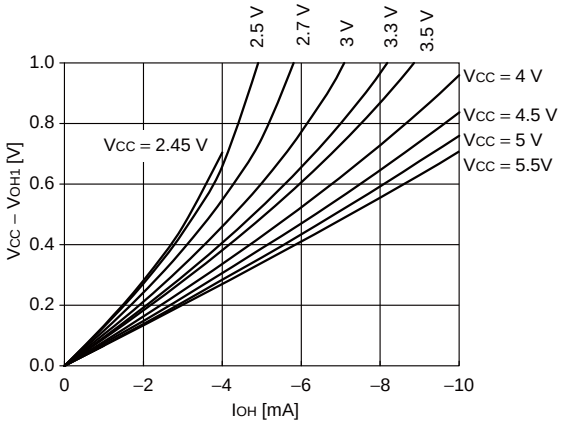


V_{IHM} – V_{CC} and V_{ILM} – V_{CC}
T_A = + 25 °C

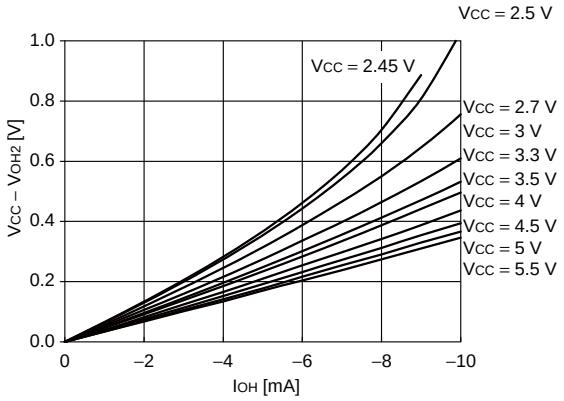


• **Output voltage**

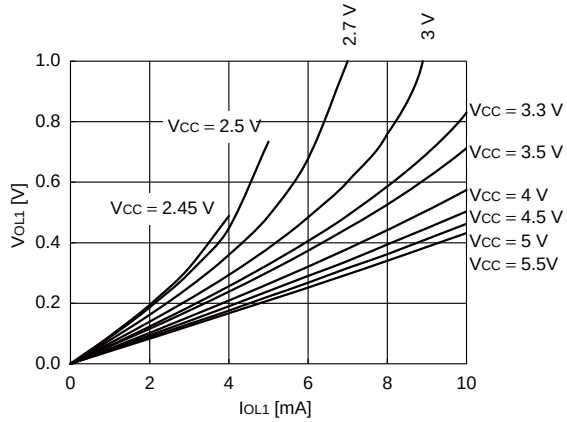
$(V_{CC}-V_{OH1})$ – I_{OH}
T_A = + 25 °C



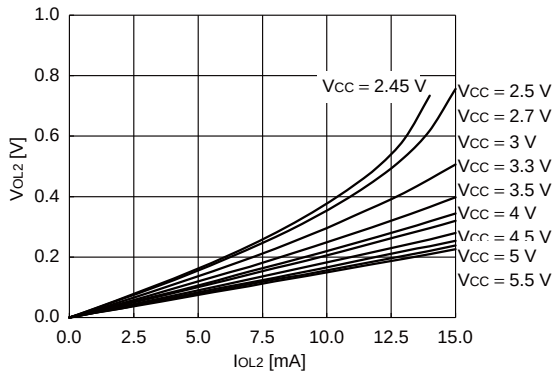
$(V_{CC}-V_{OH2})$ – I_{OH}
T_A = + 25 °C



V_{OL1} – I_{OL1}
T_A = + 25 °C



V_{OL2} – I_{OL2}
T_A = + 25 °C



• **Pull-up**

R_{PULL} – V_{CC}
T_A = + 25 °C

■ PACKAGE DIMENSIONS

100-pin plastic LQFP		
	Lead pitch	0.50 mm
	Package width × package length	14.0 mm × 14.0 mm
	Lead shape	Gullwing
	Sealing method	Plastic mold
	Mounting height	1.70 mm Max
	Weight	0.65 g
(FPT-100P-M20)	Code (Reference)	P-LFQFP100-14×14-0.50

■ MAIN CHANGES IN THIS EDITION

Page	Section	Change Results
5	■ PRODUCT LINEUP	Changed the Note. (MB2146-303 → MB2146-303A-E)
17	■ HANDLING DEVICES	Added the item of " • Serial communication".
36	■ ELECTRICAL CHARACTERISTICS 2. Recommended Operating Conditions	Changed *2 under the table.
76	■ ORDERING INFORMATION	Changed the part number. (MB2146-303 → MB2146-303A-E)

The vertical lines marked in the left side of the page show the changes.
