Settling time		From 50% control until harmonics within specifications		30	70	μs
Switching time		50% CTRL to 90% or 10% RF		15		μs

Notes: 1. In a 2TX–1RX SP3T configuration, TX1 and TX2 are tied and TX3 and TX4 are tied respectively. Refer to Application Note AN35 for SP3T performance data.
2. Narrow trace widths are used near each port to improve impedance matching. Refer to evaluation board layouts (Figure 23) and schematic (Figure 24) for details.
3. 10% of 4620 μs period.
4. The input 0.1dB compression point is a linearity figure of merit. Refer to Table 3 for the RF input power P_{IN} .

Figure 4. Pin Configuration (Top View)*

Note: * Pins 1, 3, 5, 7, 9, 10, 17, 19, 20, 22, 24, 26, 27, 29, 30 and 31 can be N/C if deemed necessary by the customer.

Table 2. Pin Descriptions

Pin #	Pin Name	Description
1, 3, 5–7, 9–11, 17–20, 22, 24–27, 29–32	GND	Ground
2	TX1 ²	Transmit pin 1
4	TX2 ^{1,2}	Transmit pin 2
8	RX ²	Receive pin
12	V _{DD}	Supply voltage (nominal 3.3V)
13	V3	Digital control logic input 3
14	V2	Digital control logic input 2
15	V1	Digital control logic input 1
16	V _{SS_EXT} ³	External V _{SS} negative voltage control
21	TX3 ²	Transmit pin 3
23	TX4 ^{1,2}	Transmit pin 4
28	ANT ²	Antenna pin
Pad	GND	Exposed pad: ground for proper operation

Notes: 1. To operate the part as a 2TX–1RX SP3T, tie TX1 to TX2 and TX3 to TX4 respectively. Refer to Application Note AN35 for SP3T performance data.
2. RF pins 2, 4, 8, 21, 23 and 28 must be at 0 VDC. The RF pins do not require DC blocking capacitors for proper operation if the 0 VDC requirement is met.
3. Use V_{SS_EXT} (pin 16, V_{SS_EXT} = –V_{DD}) to bypass and disable internal negative voltage generator. Connect V_{SS_EXT} (pin 16) to GND (V_{SS_EXT} = 0V) to enable internal negative voltage generator.

Table 3. Operating Ranges¹

Parameter	Symbol	Min	Typ	Max	Unit
Supply voltage (normal mode, V _{SS_EXT} = 0V)	V _{DD}	2.3		5.5	V
Supply voltage (bypass mode, V _{SS_EXT} = –3.4V, V _{DD} ≥ 3.4V for full spec. compliance)	V _{DD}	2.7	3.4	5.5	V
Negative supply voltage (bypass mode)	V _{SS_EXT}	–3.6		–3.2	V
Supply current (normal mode, V _{SS_EXT} = 0V)	I _{DD}		130	200	μA
Supply current (bypass mode, V _{SS_EXT} = –3.4V)	I _{DD}		50	80	μA
Negative supply current (bypass mode, V _{SS_EXT} = –3.4V)	I _{SS}	–40	–16		μA
Digital input high (V1, V2, V3)	V _{IH}	1.17		3.6	V
Digital input low (V1, V2, V3)	V _{IL}	–0.3		0.6	V
TX RF input power ^{2,3} (VSWR ≤ 8:1)	P _{IN-TX}			40	dBm
TX RF input power ^{2,3} (50Ω source/load impedance)	P _{IN-TX}			45	dBm
TX RF input power ² (50Ω source/load impedance, CW)	P _{IN-TX}			42.5	dBm
ANT RF input power, unbiased (VSWR ≤ 8:1)	P _{IN-ANT}			27	dBm
RX RF input power ² (VSWR ≤ 8:1)	P _{IN-RX}			27	dBm
Operating temperature range (case)	T _{OP}	–40		85	°C
Operating junction temperature	T _j			135	°C

Notes: 1. In a 2TX–1RX SP3T configuration, TX1 and TX2 are tied and TX3 and TX4 are tied respectively. Refer to Application Note AN35 for SP3T performance data.
2. Supply biased.
3. Pulsed, 10% duty cycle of 4620 μs period.

Table 4. Absolute Maximum Ratings

Parameter/Condition	Symbol	Min	Max	Unit
Supply voltage	V _{DD}	−0.3	5.5	V
Digital input voltage (V1, V2, V3)	V _{CTRL}	−0.3	3.6	V
TX RF input power ¹ (50Ω source/load impedance)	P _{IN-TX}		45	dBm
TX RF input power ¹ (VSWR ≤ 8:1)	P _{IN-TX}		40	dBm
ANT RF input power, unbiased (VSWR ≤ 8:1)	P _{IN-ANT}		27	dBm
RX RF input power ¹ (VSWR ≤ 8:1)	P _{IN-RX}		27	dBm
Storage temperature range	T _{ST}	−65	150	°C
Maximum case temperature	T _{CASE}		85	°C
Peak maximum junction temperature (10 seconds max)	T _J		200	°C
ESD voltage HBM ² , all pins	V _{ESD}		1500	V
ESD Voltage MM ³ , all pins	V _{ESD}		200	V

Notes: 1. Supply biased
2. Human Body Model (MIL-STD 883 Method 3015)
3. Machine Model (JEDEC JESD22-A115)

Exceeding absolute maximum ratings may cause permanent damage. Operation should be restricted to the limits in the Operating Ranges table. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified.

Latch-Up Avoidance

Unlike conventional CMOS devices, UltraCMOS devices are immune to latch-up.

Moisture Sensitivity Level

The Moisture Sensitivity Level rating for the 5x5 mm QFN package is MSL3.

Switching Frequency

The PE42850 has a maximum 10 kHz switching rate when the internal negative voltage generator is used (pin 16 = GND). The rate at which the PE42850 can be switched is only limited to the switching time (*Table 1*) if an external negative supply is provided (pin 16 = V_{SS_EXT}).

Switching frequency describes the time duration between switching events. Switching time is the time duration between the point the control signal reaches 50% of the final value and the point the output signal reaches within 10% or 90% of its target value.

Optional External V_{SS} Control (V_{SS_EXT})

For proper operation, the V_{SS_EXT} control pin must be grounded or tied to the V_{SS} voltage specified in *Table 3*. When the V_{SS_EXT} control pin is grounded, FETs in the switch are biased with an internal voltage generator. For applications that require the lowest possible spur performance, V_{SS_EXT} can be applied externally to bypass the internal negative voltage generator.

Spurious Performance

The typical spurious performance of the PE42850 is −130 dBm when V_{SS_EXT} = 0V (pin 16 = GND). If further improvement is desired, the internal negative voltage generator can be disabled by setting V_{SS_EXT} = −3.4V.

Table 5. Truth Table

Path	V3	V2	V1
ANT – RX Attenuated	L	L	L
ANT – TX1	L	L	H
ANT – TX2	L	H	L
ANT – TX1 and TX2*	L	H	H
ANT – RX	H	L	L
ANT – TX3	H	L	H
ANT – TX4	H	H	L
ANT – TX3 and TX4*	H	H	H

Note: * In a 2TX–1RX SP3T configuration, TX1 and TX2 are tied and TX3 and TX4 are tied respectively. Refer to Application Note AN35 for SP3T performance data.

Thermal Data

Though the insertion loss for this part is very low, when handling high power RF signals, the junction temperature rises significantly.

VSWR conditions that present short circuit loads to the part can cause significantly more power dissipation than with proper matching.

Special consideration needs to be made in the design of the PCB to properly dissipate the heat away from the part and maintain the +85 °C maximum case temperature. It is recommended to use best design practices for high power QFN packages: multi-layer PCBs with thermal vias in a thermal pad soldered to the slug of the package. Special care also needs to be made to alleviate solder voiding under the part.

Table 6. Theta JC

Parameter	Min	Typ	Max	Unit
Theta JC (+85 °C)		20		°C/W

Evaluation Kit

The PE42850 Evaluation Kit board was designed to ease customer evaluation of the PE42850 RF switch.

The evaluation board in Figure 23 was designed to test the part in the 5T configuration. DC power is supplied through J10, with V_{DD} on pin 9, and GND on the entire lower row of even numbered pins. To evaluate a switch path, add or remove jumpers on V1 (pin 3), V2 (pin 5), and V3 (pin 7) using *Table 5* (adding a jumper pulls the CMOS control pin low and removing it allows the on-board pull-up resistor to set the CMOS control pin high). Pins 11 and 13 of J10 are N/C.

The ANT port is connected through a 50Ω transmission line via the top SMA connector, J1. RX and TX paths are also connected through 50Ω transmission lines via SMA connectors. A 50Ω through transmission line is available via SMA connectors J8 and J9. This transmission line can be used to estimate the loss of the PCB over the environmental conditions being evaluated. An open-ended 50Ω transmission line is also provided at J7 for calibration if needed.

Narrow trace widths are used near each part to improve impedance matching.

Figure 23. Evaluation Board Layouts

PRT-50283

The schematic diagram illustrates a 100 MHz 10-bit DAC circuit. At the core is the PE42850 transceiver (U1), which interfaces between the DAC and the SMA connectors. The DAC (J10) is a 10-bit device with a 50 Ohm load (Z1) and a 50 Ohm through line (Z2). The circuit is powered by a 1.5V supply (VDD) and a 0.01uF capacitor (C3). The DAC output is connected to a 10-bit header (J10) and a 10-bit DAC (J10). The circuit is designed for a 100 MHz signal rate.
