# 1. Ordering Guide

### **Industrial and Automotive Grade OPNs**

Industrial-grade devices (part numbers having an "-I" in their suffix) are built using well-controlled, high-quality manufacturing flows to ensure robustness and reliability. Qualifications are compliant with JEDEC, and defect reduction methodologies are used throughout definition, design, evaluation, qualification, and mass production steps.

Automotive-grade devices (part numbers having an "-A" in their suffix) are built using automotive-specific flows at all steps in the manufacturing process to ensure robustness and low defectivity. These devices are supported with AIAG-compliant Production Part Approval Process (PPAP) documentation, and feature International Material Data System (IMDS) and China Automotive Material Data System (CAMDS) listing. Qualifications are compliant with AEC-Q100, and a zero-defect methodology is employed throughout definition, de-sign, evaluation, qualification, and mass production steps.

Table 1.1. Si827x Ordering Guide<sup>1, 2, 3</sup>

Ordering Part Number	Automotive OPN <sup>4, 5</sup>	Inputs	Driver Configuration <sup>6</sup>	Output UVLO (V)	Integrated Deglitcher	Dead- Time Range (ns)	Low Jitter	Package	Isolation Rating
2.5 kV <sub>RMS</sub> Isolation	on Options

- 1. All packages are RoHS-compliant with peak reflow temperatures of 260 °C according to the JEDEC industry standard classifications.
- 2. "Si" and "SI" are used interchangeably.
- 3. An "R" at the end of the Ordering Part Number indicates tape and reel option.
- 4. Automotive-Grade devices (with an "-A" suffix) are identical in construction materials and electrical parameters to their Industrial-Grade (with an "-I" suffix) version counterpart. Automotive-Grade products are produced utilizing full automotive process flows and additional statistical process controls throughout the manufacturing flow. The Automotive-Grade part number is included on shipping labels.
- 5. In Top Markings, the Manufacturing Code represented by "TTTTT" contains, as its first character, a letter in the range N through Z to indicate Automotive-Grade.
- 6. All HS/LS drivers have built-in overlap protection while the single and dual drivers do not.

# 2. System Overview

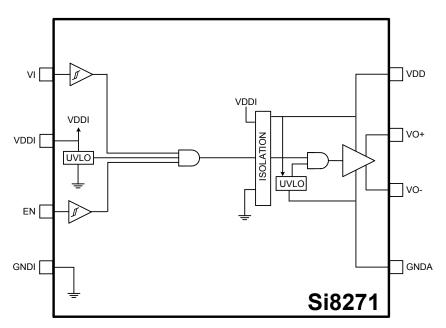

Figure 2.1. Si8271 Block Diagram

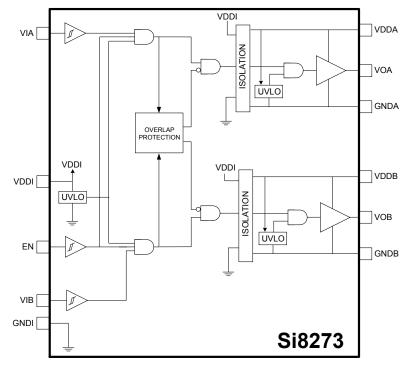

Figure 2.2. Si8273 Block Diagram

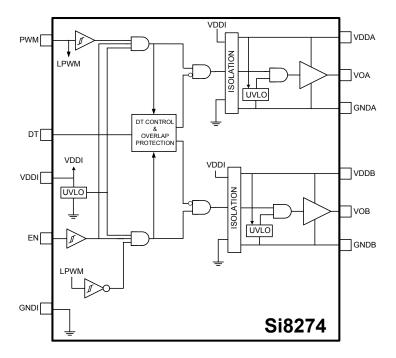

Figure 2.3. Si8274 Block Diagram

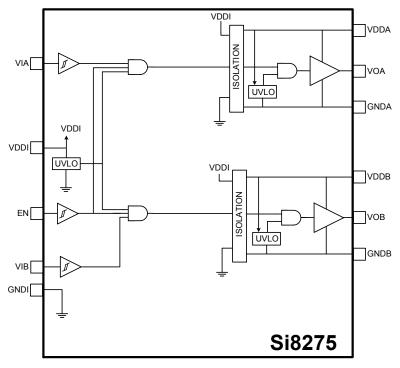

Figure 2.4. Si8275 Block Diagram

The operation of an Si827x channel is analogous to that of an optocoupler and gate driver, except an RF carrier is modulated instead of light. This simple architecture provides a robust isolated data path and requires no special considerations or initialization at start-up. A simplified block diagram for a single Si827x channel is shown in the figure below.

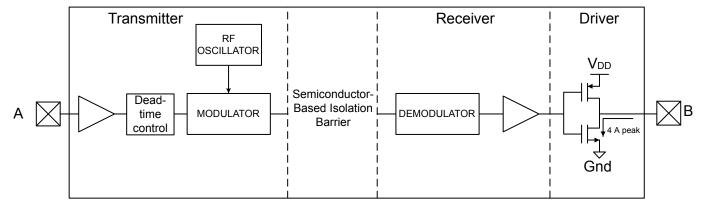

Figure 2.5. Simplified Channel Diagram

A channel consists of an RF Transmitter and RF Receiver separated by a semiconductor-based isolation barrier. Referring to the Transmitter, input A modulates the carrier provided by an RF oscillator using on/off keying. The Receiver contains a demodulator that decodes the input state according to its RF energy content and applies the result to output B via the output driver. This RF on/off keying scheme is superior to pulse code schemes as it provides best-in-class noise immunity, low power consumption, and better immunity to magnetic fields. See Figure 2.6 Modulation Scheme on page 9 for more details.

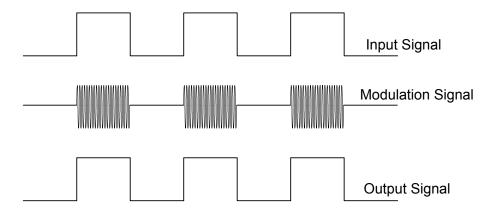

Figure 2.6. Modulation Scheme

### 2.1 Typical Operating Characteristics

The typical performance characteristics depicted in the figures below are for information purposes only. Refer to Table 4.1 Electrical Characteristics on page 21 for actual specification limits.

### 2.2 Family Overview and Logic Operation During Startup

The Si827x family of isolated drivers consists of single, high-side/low-side, and dual driver configurations.

### 2.2.1 Products

The table below shows the configuration and functional overview for each product in this family.

Table 2.1. Si827x Family Overview

Part Number	Configuration	Overlap	Programmable	Inputs	Peak Output
		Protection	Dead Time		Current (A)
Si8271	Single Driver	_	_	VI	4.0
Si8273	High-Side/Low-Side	Y	_	VIA, VIB	4.0
Si8274	PWM	Y	Y	PWM	4.0
Si8275	Dual Driver	_	_	VIA, VIB	4.0

### 2.2.2 Device Behavior

The following table consists of truth tables for the Si8273, Si8274, and Si8275 families.

1 Thi	e truth ta	hla assumas VI	V bne ACC	DDR are n	owered If	VDDA and VDDB are below UVLO, see 2.6.2 Undervoltage Lockout

<sup>1.</sup> This truth table assumes VDDA and VDDB are powered. If VDDA and VDDB are below UVLO, see 2.6.2 Undervoltage Lockout for more information.

<sup>2.</sup> An input can power the input die through an internal diode if its source has adequate current.

### 2.3 Power Supply Connections

Isolation requirements mandate individual supplies for VDDI, VDDA, and VDDB. The decoupling caps for these supplies must be placed as close to the VDD and GND pins of the Si827x as possible. The optimum values for these capacitors depend on load current and the distance between the chip and the regulator that powers it. Low effective series resistance (ESR) capacitors, such as Tantalum, are recommended.

### 2.4 Power Dissipation Considerations

Proper system design must assure that the Si827x operates within safe thermal limits across the entire load range. The Si827x total power dissipation is the sum of the power dissipated by bias supply current, internal parasitic switching losses, and power dissipated by the series gate resistor and load. The equation below shows total Si827x power dissipation.

$$P_D = (\text{VDDI})(\text{IDDI}) + 2(\text{IDDx})(\text{VDDx}) + (f)(Q_G)(\text{VDDx})[\frac{R_P}{R_P + R_G}] + (f)(Q_G)(\text{VDDx})[\frac{R_N}{R_N + R_G}] + 2fC_{\text{INT}}\text{VDDx}^2$$

where:

P<sub>D</sub> is the total Si827x device power dissipation (W)

IDDI is the input-side maximum bias current (10 mA)

IDDx is the driver die maximum bias current (4 mA)

C<sub>INT</sub> is the internal parasitic capacitance (370 pF)

VDDI is the input-side VDD supply voltage (2.5 to 5.5 V)

VDDx is the driver-side supply voltage (4.2 to 30 V)

f is the switching frequency (Hz)

Q<sub>G</sub> is the gate charge of the external FET

R<sub>G</sub> is the external gate resistor

 $R_P$  is the  $R_{DS(ON)}$  of the driver pull-up switch (2.7  $\Omega$ )

 $R_N$  is the  $R_{DS(ON)}$  of the driver pull-down switch (1  $\Omega$ )

# **Equation 1**

For example, the total power dissipation for an application can be found using Equation 1 and the following application-specific values:

**VDDI = 5.0 V** 

**VDDx = 12 V** 

f = 350 kHz

 $R_G = 22 \Omega$ 

 $Q_G = 25 nC$ 

With these application-specific values, Equation 1 yields  $P_D = 199 \text{ mW}$ .

The driver junction temperature is calculated using Equation 2, shown below.

$$T_J = P_D \times_{JA} + T_A$$

where:

P<sub>D</sub> is the total Si827x device power dissipation (W), as determined by Equation 1.

 $\theta_{JA}$  is the thermal resistance from junction to air (°C/W)

T<sub>A</sub> is the ambient temperature (°C)

### **Equation 2**

Continuing the example above, the driver junction temperature can be determined using the result of Equation 1 and Equation 2 with the following application-specific values:

$$\theta_{JA} = 66 \, ^{\circ}\text{C/W}$$

$$T_A = 20 \, ^{\circ}C$$

With these application-specific values, Equation 2 yields  $T_J$  = 33.1  $^{\circ}$ C.

The maximum power dissipation allowable for the Si827x, for any given application, is a function of the package thermal resistance, ambient temperature, and maximum allowable junction temperature, as shown in Equation 3 below.

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{JA}$$

where:

P<sub>D(MAX)</sub> is the maximum Si827x power dissipation (W)

T<sub>J(MAX)</sub> is the maximum Si827x junction temperature (150 °C)

T<sub>A</sub> is the ambient temperature (°C)

 $\theta_{JA}$  is the Si827x junction-to-air thermal resistance (°C/W)

### **Equation 3**

Continuing our example from the previous page and using the results of Equation 1 and Equation 2 as inputs to Equation 3, along with the example values of  $T_A$  and  $\theta_{AA}$  previously given, yields a maximum allowable power dissipation of 1.97 W.

Maximum allowable gate charge as a function of switching frequency is found by substituting the maximum allowable power dissipation limit and the appropriate data sheet values from Table 4.1 Electrical Characteristics on page 21 into Equation 1 and simplifying. For our example, the result is Equation 4, which assumes VDDI = 5 V and VDDA = VDDB = 12 V, and can be easily charted to visualize design constraints as is demonstrated by Figure 2.17 below.

$$Q_{G(MAX)} = \frac{0.995}{f} - 1.06 \times 10^{-7}$$

### **Equation 4**

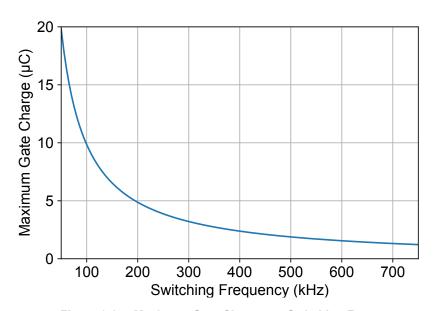

Figure 2.17. Maximum Gate Charge vs. Switching Frequency

### 2.5 Layout Considerations

It is most important to minimize ringing in the drive path and noise on the Si827x VDD lines. Care must be taken to minimize parasitic inductance in these paths by locating the Si827x as close to the device it is driving as possible. In addition, the VDD supply and ground trace paths must be kept short. For this reason, the use of power and ground planes is highly recommended. A split ground plane system having separate ground and VDD planes for power devices and small signal components provides the best overall noise performance.

### 2.6 Undervoltage Lockout Operation

Device behavior during start-up, normal operation and shutdown is shown in the Figure 2.18 on page 16, where UVLO+ and UVLO- are the positive-going and negative-going thresholds respectively.

It's important to note that the driver outputs (VO) will default to a low output state when the input side power supply (VDDI) is not present, but the output side power supply (VDDx) is present.

### 2.6.1 Device Startup

Driver outputs (VO) are held low during power-up until the device power supplies are above the UVLO threshold for time period t<sub>START</sub>. Following this, the outputs follow the state of device inputs (VI).

### 2.6.2 Undervoltage Lockout

Undervoltage Lockout (UVLO) is provided to prevent erroneous operation during device startup and shutdown or when the device power supplies are below their specified operating circuits range. The input (control) side, and each driver on the output side, have their own undervoltage lockout monitors.

The Si827x input side enters UVLO when VDDI < VDDI<sub>UV</sub>, and exits UVLO when VDDI > VDDI<sub>UV</sub>. The driver output (VO) remains low when the input side of the Si827x is in UVLO and VDDx is within tolerance. Each driver output can enter or exit UVLO independently. For example, VOA unconditionally enters UVLO when VDDA falls below VDDA<sub>UV</sub> and exits UVLO when VDDA rises above VDDA<sub>UV</sub>.

The UVLO circuit unconditionally drives VO low when VDDx is below the lockout threshold. Upon power up, the Si827x is maintained in UVLO until VDDx rises above VDDx<sub>UV+</sub>. During power down, the Si827x enters UVLO when VDDx falls below VDDx<sub>UV-</sub>. Please refer to spec tables for UVLO values.

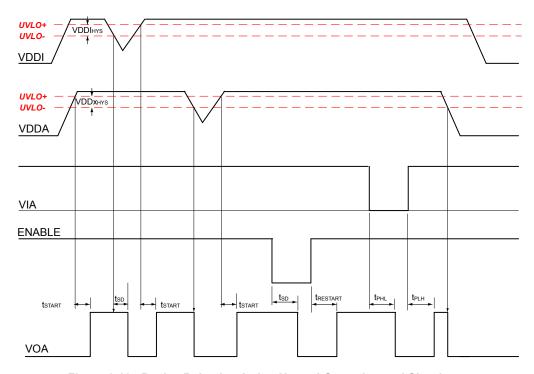

Figure 2.18. Device Behavior during Normal Operation and Shutdown

#### 2.6.3 Control Inputs

VIA, VIB, and PWM inputs are high-true, TTL level-compatible logic inputs. A logic high signal on VIA or VIB causes the corresponding output to go high. For PWM input versions (Si8274), VOA is high and VOB is low when the PWM input is high, and VOA is low and VOB is high when the PWM input is low.

### 2.6.4 Enable Input

When brought low, the ENABLE input unconditionally drives VOA and VOB low regardless of the states of VIA and VIB. Device operation terminates within  $t_{SD}$  after ENABLE =  $V_{IL}$  and resumes within  $t_{RESTART}$  after ENABLE =  $V_{IH}$ . The ENABLE input has no effect if VDDI is below its UVLO level (i.e., VOA, VOB remain low).

### 2.7 Overlap Protection and Programmable Dead Time

Overlap protection prevents the two driver outputs from both going high at the same time. Programmable dead time control sets the amount of time between one output going low and the other output going high.

All drivers configured as high-side/low-side pairs with separate inputs (Si8273x) have overlap protection. See Figure 2.19 on page 17 and Table 2.3 on page 17. Drivers controlled with a single input (Si8274x) have inherit overlap protection by virtue of one driver being active high and the other being active low with respect to the PWM input.

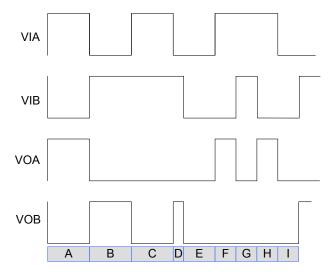

Figure 2.19. Input and Output Waveforms for Si8273x Drivers

Table 2.3. Description of Input and Output Waveforms for Si8273x Drivers

Reference	Description
Α	Normal operation: VIA high, VIB low.
В	Normal operation: VIB high, VIA low.
С	Contention: VIA = VIB = high.
D	Recovery from contention: VIA transitions low.
E	Normal operation: VIA = VIB = low.
F	Normal operation: VIA high, VIB low.
G	Contention: VIA = VIB = high.
Н	Recovery from contention: VIB transitions low.
1	Normal operation: VIB transitions high.

All high-side/low-side drivers with a single PWM input (Si8274x) include programmable dead time, which adds a user-programmable delay between transitions of VOA and VOB. When enabled, dead time is present on all transitions. The amount of dead time delay (DT) is programmed by a single resistor (RDT) connected from the DT input to ground per the equation below. Note that the dead time pin should be connected to GNDI through a resistor between the values of 6 k $\Omega$  and 100 k $\Omega$ . A filter capacitor of 100 pF in parallel with RDT is recommended. See Figure 2.20 on page 18 below.

 $DT = 2.02 \times RDT + 7.77$  (for 10-200 ns range)

 $DT = 6.06 \times RDT + 3.84$  (for 20-700 ns range)

where:

DT is the dead time (ns)

RDT is the dead time programming resistor ( $k\Omega$ )

# **Equation 4**

Typical Dead Time Operation

Figure 2.20. Dead-Time Waveforms for Si8274x Drivers

# 2.8 Deglitch Feature

A deglitch feature is provided on some options, as defined in the 1. Ordering Guide. The internal deglitch circuit provides an internal time delay of 15 ns typical, during which any noise is ignored and will not pass through the IC. For these product options, the propagation delay will be extended by 15 ns, as specified in the spec table.

# 3. Applications

The following examples illustrate typical circuit configurations using the Si827x.

# 3.1 High-Side/Low-Side Driver

In the figure below, side A shows the Si8273 controlled using the VIA and VIB input signals, and side B shows the Si8274 controlled by a single PWM signal.

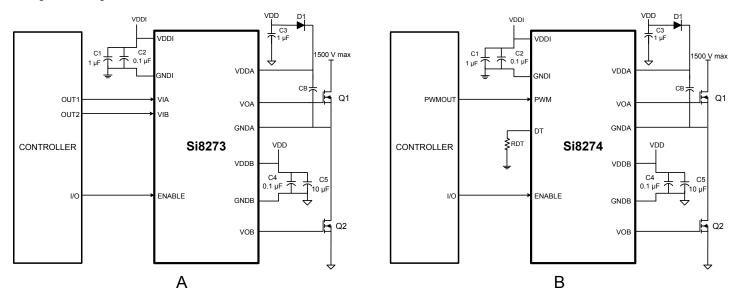

Figure 3.1. Si827x in Half-Bridge Application

For both cases, D1 and CB form a conventional bootstrap circuit that allows VOA to operate as a high-side driver for Q1, which has a maximum drain voltage of 1500 V. VOB is connected as a conventional low-side driver. Note that the input side of the Si827x requires VDDI in the range of 2.5 to 5.5 V, while the VDDA and VDDB output side supplies must be between 4.2 and 30 V with respect to their respective grounds. The boot-strap start up time will depend on the CB capacitor chosen. VDD is usually the same as VDDB. Also, note that the bypass capacitors on the Si827x should be located as close to the chip as possible. Moreover, it is recommended that bypass capacitors be used (as shown in the figures above for input and driver side) to reduce high frequency noise and maximize performance. The outputs VOA and VOB can be used interchangeably as high side or low side drivers.

#### 3.2 Dual Driver

The figure below shows the Si827x configured as a dual driver. Note that the drain voltages of Q1 and Q2 can be referenced to a common ground or to different grounds with as much as 1500 V dc between them.

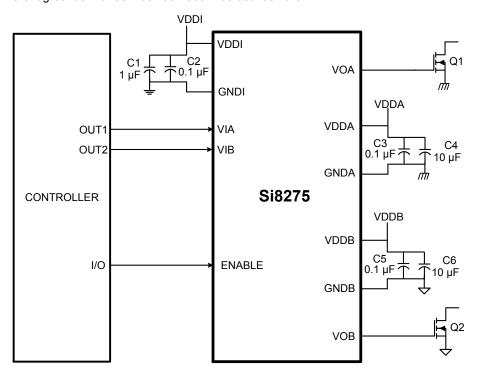

Figure 3.2. Si827x in a Dual Driver Application

Because each output driver resides on its own die, the relative voltage polarities of VOA and VOB can reverse without damaging the driver. That is, the voltage at VOA can be higher or lower than that of VOB by VDD without damaging the driver. Therefore, a dual driver in a high-side/low-side drive application can use either VOA or VOB as the high side driver. Similarly, a dual driver can operate as a dual low-side or dual high-side driver and is unaffected by static or dynamic voltage polarity changes.

# 4. Electrical Specifications

**Table 4.1. Electrical Characteristics** 

VDDI = 2.5 to 5.5 V; VDDx - GNDx = 4.2 to 30 V;  $T_A$  = -40 to +125  $^{\circ}C$ 

Typical specifications at VDDI = 5 V; VDDx - GNDx = 15 V;  $T_A$  = 25  $^{\circ}C$  unless otherwise noted

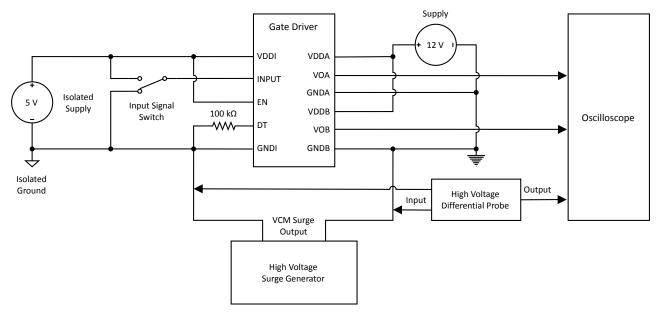

Figure 4.3. Common Mode Transient Immunity Test Circuit

# 4.2 Regulatory Information (Pending)

Table 4.2. Regulatory Information<sup>1,2</sup>

### **CSA**

The Si827x is certified under CSA. For more details, see Master Contract Number 232873.

60950-1: Up to 125 V<sub>RMS</sub> reinforced insulation working voltage; up to 600 V<sub>RMS</sub> basic insulation working voltage.

# **VDE**

The Si827x is certified according to VDE 0884-10. For more details, see Certificate 40018443.

VDE 0884-10: Up to 630 V<sub>peak</sub> for basic insulation working voltage.

# UL

The Si827x is certified under UL1577 component recognition program. For more details, see File E257455.

Rated up to 2500 V<sub>RMS</sub> isolation voltage for basic protection.

### CQC

The Si827x is certified under GB4943.1-2011. For more details, see Certificates CQC 16001160284 and CQC 17001177887.

Rated up to 250 V<sub>RMS</sub> basic insulation working voltage.

- 1. Regulatory Certifications apply to 2.5 kV<sub>RMS</sub> rated devices which are production tested to 3.0 kV<sub>RMS</sub> for 1 sec.
- 2. For more information, see 1. Ordering Guide.

Table 4.3. Insulation and Safety-Related Specifications

Parameter	Symbol	Test Condition		Unit		
			SOIC-8	NB SOIC-16	DFN-14	
Nominal External Air Gap	CLR		4.7	4.7	3.5	mm
(Clearance)						
Nominal External Tracking	CPG		3.9	3.9	3.5	mm
(Creepage)						
Minimum Internal Gap	DTI		0.008	0.008	0.008	mm
(Internal Clearance)						
Tracking Resistance	PTI or CTI	IEC60112	600	600	600	V
Erosion Depth	ED		0.019	0.019	0.021	mm
Resistance	R <sub>IO</sub>		10 <sup>12</sup>	10 <sup>12</sup>	10 <sup>12</sup>	Ω
(Input-Output) <sup>1</sup>						
Capacitance	C <sub>IO</sub>	f = 1 MHz	0.5	0.5	0.5	pF
(Input-Output) <sup>1</sup>						
Input Capacitance <sup>2</sup>	C <sub>I</sub>		3.0	3.0	3.0	pF

- 1. To determine resistance and capacitance, the Si827x is converted into a 2-terminal device. All pins on side 1 are shorted to create terminal 1, and all pins on side 2 are shorted to create terminal 2. The parameters are then measured between these two terminals.
- 2. Measured from input pin to ground.

Table 4.4. IEC 60664-1 Ratings

Parameter	Test Condition Specification			
		SOIC-8	NB SOIC-16	DFN-14
Basic Isolation Group	Material Group	I	I	I
Installation Classification	Rated Mains Voltages < 150 V <sub>RMS</sub>	I-IV	I-IV	I-IV
	Rated Mains Voltages < 300 V <sub>RMS</sub>	I-III	I-III	1-111
	Rated Mains Voltages < 400 V <sub>RMS</sub>	I-II	I-II	I-II
	Rated Mains Voltages < 600 V <sub>RMS</sub>		I-II	I-II

Table 4.5. VDE 0884 Insulation Characteristics<sup>1</sup>

Parameter	Symbol	Test Condition	Characteristic	Unit
Maximum Working Insulation Voltage	V <sub>IORM</sub>		630	V peak
Input to Output Test Voltage	V <sub>PR</sub>	Method b1 (V <sub>IORM</sub> x 1.875 = V <sub>PR</sub> , 100% Production Test, t <sub>m</sub> = 1 sec, Partial Discharge < 5 pC)	1181	V peak
Transient Overvoltage	$V_{IOTM}$	t = 60 sec	4000	V peak
Surge Voltage	$V_{IOSM}$	Tested per IEC 60065 with surge voltage of 1.2 µs/50 µs  Tested with 4000 V	3077	Vpeak
Pollution Degree			2	
(DIN VDE 0110, Table 1)				
Insulation Resistance at T <sub>S</sub> , V <sub>IO</sub> = 500 V	R <sub>S</sub>		>10 <sup>9</sup>	Ω

### Note:

Table 4.6. IEC Safety Limiting Values<sup>1</sup>

Parameter	Symbol	Test Condition		SOIC-8	NB SOIC-16	DFN-14	Unit
Safety Temperature	T <sub>S</sub>			150	150	150	°C
Safety Input Current	I <sub>S</sub>		115 °C/W (SOIC-8),	36	63	38	mA
		θ <sub>JA</sub> =	66 °C/W (NB SOIC-16),				
			110° C/W (DFN-14),				
		VDDI =	5.5 V				
		VDDx =	30 V				
		T <sub>J</sub> =	150 °C				
		T <sub>A</sub> =	25 °C				
Device Power Dissipation	P <sub>D</sub>			1.1	1.2	1.2	W

### Note:

1. Maximum value allowed in the event of a failure. Refer to the thermal derating curve in the two figures below.

<sup>1.</sup> Maintenance of the safety data is ensured by protective circuits. The Si827x provides a climate classification of 40/125/21.

**Table 4.7. Thermal Characteristics** 

Parameter	Symbol	SOIC-8	NB SOIC-16	DFN-14	Unit
IC Junction-to-Air Thermal Resistance	θ <sub>JA</sub>	115	66	110	°C/W

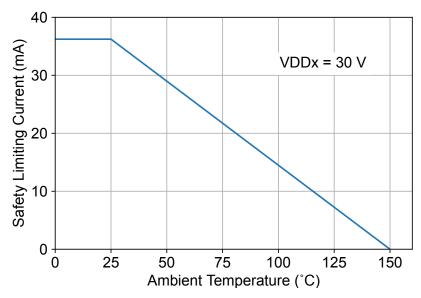

Figure 4.4. NB SOIC-8 Thermal Derating Curve, Dependence of Safety Limiting Values per VDE

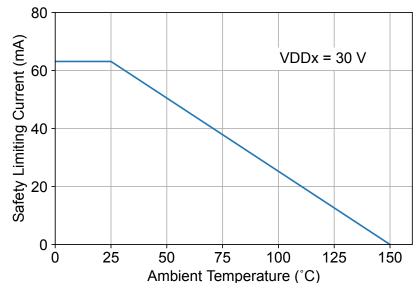

Figure 4.5. NB SOIC-16 Thermal Derating Curve, Dependence of Safety Limiting Values per VDE

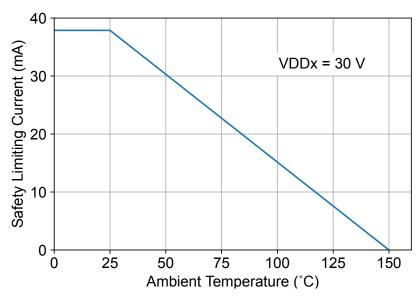

Figure 4.6. DFN-14 Thermal Derating Curve, Dependence of Safety Limiting Values per VDE

Table 4.8. Absolute Maximum Ratings<sup>1</sup>

Parameter	Symbol	Min	Max	Units
Storage Temperature	T <sub>STG</sub>	-65	+150	°C
Operating Temperature	T <sub>A</sub>	-40	+125	°C
Junction Temperature	T <sub>J</sub>	_	+150	°C
Input-side supply voltage	VDDI	-0.6	6.0	V
Driver-side supply voltage	VDD, VDDA, VDDB	-0.6	36	V
Voltage on any input pin with respect to ground	VI, VIA, VIB, EN, DT	-0.5	VDD + 0.5	V
	VO+, VO-, VOA, VOB	-0.5		
Voltage on any input pin with respect to ground <sup>2</sup>	VO+, VO-, VOA, VOB	-1.2	VDD + 0.5	V
	Transient for 200 ns			
Peak Output Current (t <sub>PW</sub> = 10 μs, duty cycle = 0.2%)	I <sub>OPK</sub>	_	4.0	А
Lead Solder Temperature (10 s)		_	260	°C
HBM Rating ESD		_	3.5	kV
CDM		_	2000	V
Maximum Isolation Voltage (Input to Output) (1 sec)		_	3000	V <sub>RMS</sub>
NB SOIC-16 and SOIC-8				
Maximum Isolation Voltage (Input to Output) (1 sec)		_	3000	V <sub>RMS</sub>
DFN-14				
Maximum Isolation Voltage (Output to Output) (1 sec)		_	1500	V <sub>RMS</sub>
NB SOIC-16				
Maximum Isolation Voltage (Output to Output) (1 sec)		_	650	V <sub>RMS</sub>
DFN-14				
Latch-up Immunity		_	400	kV/μs

<sup>1.</sup> Permanent device damage may occur if the absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions specified in the operational sections of this data sheet.

<sup>2.</sup> Transient voltage pulse repeatable at 200 kHz.

# 6. Package Outlines

# 6.1 Package Outline: 16-Pin Narrow-Body SOIC

The figure below illustrates the package details for the Si827x in a 16-pin narrow-body SOIC (SO-16). The table below lists the values for the dimensions shown in the illustration.

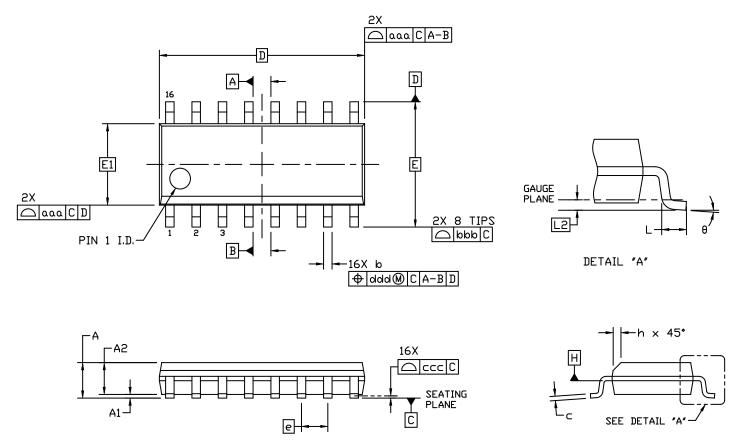

Figure 6.1. 16-pin Small Outline Integrated Circuit (SOIC) Package

Table 6.1. Package Diagram Dimensions

Dimension	Min	Max	Dimension	Min	Max
Α	_	1.75	L	0.40	1.27
A1	0.10	0.25	L2	0.25	BSC
A2	1.25	_	h	0.25	0.50
b	0.31	0.51	θ	0°	8°
С	0.17	0.25	aaa	0.	10
D	9.90 BSC		bbb	0.	20
E	6.00 BSC		ccc	0.	10
E1	3.90 BSC		ddd	0.	25
е	1.27	BSC			

- 1. All dimensions shown are in millimeters (mm) unless otherwise noted.
- 2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
- 3. This drawing conforms to the JEDEC Solid State Outline MS-012, Variation AC.
- 4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

# 6.2 Package Outline: 8-Pin Narrow Body SOIC

SIDE VIEW

The figure below illustrates the package details for the Si827x in an 8-pin narrow-body SOIC package. The table below lists the values for the dimensions shown in the illustration.

<sup>1.</sup> All dimensions shown are in millimeters (mm) unless otherwise noted.

<sup>2.</sup> Dimensioning and Tolerancing per ANSI Y14.5M-1994.

### 7. Land Patterns

# 7.1 Land Pattern: 16-Pin Narrow Body SOIC

The figure below illustrates the recommended land pattern details for the Si827x in a 16-pin narrow-body SOIC. The table below lists the values for the dimensions shown in the illustration.

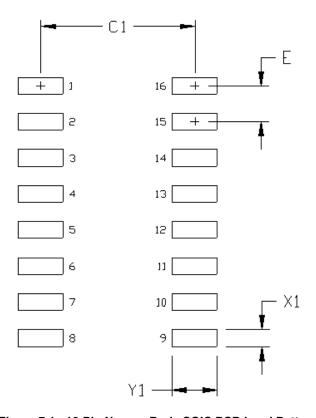

Figure 7.1. 16-Pin Narrow Body SOIC PCB Land Pattern

Table 7.1. 16-Pin Narrow Body SOIC Land Pattern Dimensions

Dimension	Feature	(mm)
C1	Pad Column Spacing	5.40
E	Pad Row Pitch	1.27
X1	Pad Width	0.60
Y1	Pad Length	1.55

- 1. This Land Pattern Design is based on IPC-7351 pattern SOIC127P600X165-16N for Density Level B (Median Land Protrusion).
- 2. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.

### 7.2 Land Pattern: 8-Pin Narrow Body SOIC

The figure below illustrates the recommended land pattern details for the Si827x in an 8-pin narrow-body SOIC. The table below lists the values for the dimensions shown in the illustration.

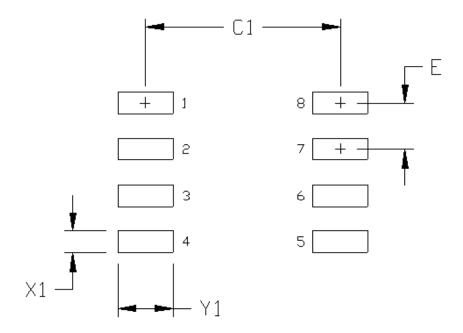

Figure 7.2. 8-Pin Narrow Body SOIC Land Pattern

Table 7.2. 8-Pin Narrow Body SOIC Land Pattern Dimensions

Dimension	Feature	(mm)
C1	Pad Column Spacing	5.40
E	Pad Row Pitch	1.27
X1	Pad Width	0.60
Y1	Pad Length	1.55

- 1. This Land Pattern Design is based on IPC-7351 pattern SOIC127P600X173-8N for Density Level B (Median Land Protrusion).
- 2. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.

#### 7.3 Land Pattern: 14-Pin DFN

The figure below illustrates the recommended land pattern details for the Si827x in a 14-pin DFN. The table below lists the values for the dimensions shown in the illustration.

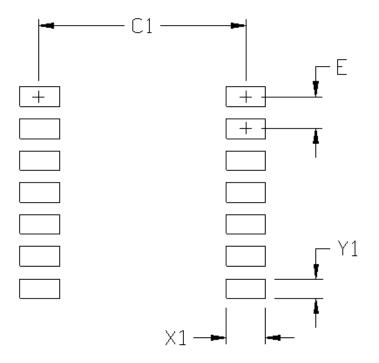

Figure 7.3. 14-Pin DFN Land Pattern

Table 7.3. 14-Pin DFN Land Pattern Dimensions

Dimension	(mm)
C1	4.20
E	0.65
X1	0.80
Y1	0.40

- 1. All dimensions shown are in millimeters (mm).
- 2. This Land Pattern Design is based on the IPC-7351 guidelines.
- 3. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.
- 4. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.
- 5. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
- 6. The stencil thickness should be 0.125 mm (5 mils).
- 7. The ratio of stencil aperture to land pad size should be 1:1.
- 8. A No-Clean, Type-3 solder paste is recommended.
- 9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

# 8. Top Markings

# 8.1 Si827x Top Marking (16-Pin Narrow Body SOIC)

Table 8.1. Top Marking Explanation (16-Pin Narrow Body SOIC)

		Si827 = ISOdriver product series
		Y = Configuration
		3 = High-side/Low-side (HS/LS)
		4 = PWM HS/LS
Line 1 Marking: <sup>1</sup>	Base Part Number Ordering Options See 1. Ordering Guide for more information.	5 = Dual driver
		U = UVLO level
		G = 3 V
		A = 5 V
		B = 8 V
		D = 12 V
		V = Isolation rating
		B = 2.5 kV
		W = Dead-time setting range
		none = not included
		1= 10-200 ns
		4 = 20-700 ns
		X = Integrated deglitch circuit
		none = not included
		D = integrated
Line 2 Marking:	YY = Year	Assigned by the Assembly House. Corresponds to the year and work
	WW = Workweek	of the mold date.
	TTTTTT = Mfg Code	Manufacturing Code from Assembly Purchase Order form. The Manufacturing Code represented by "TTTTTT" contains, as its first character, a letter in the range N through Z to indicate Automotive-Grade.

### Note:

1. Characters W and/or X are optional and may be missing from the marking line. When missing, the remaining characters are right-justified on the marking line.

# 8.2 Si8271 Top Marking (8-Pin Narrow Body SOIC)

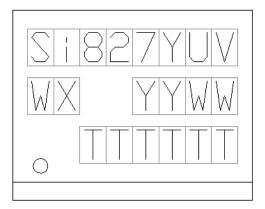

Table 8.2. Top Marking Explanation (Narrow Body SOIC)

Line 1 Marking:		Si827 = ISOdriver product series
		Y = Configuration
		1 = Single driver
		U = UVLO level
		G = 3 V
	Customer Part Number	A = 5 V
		B = 8 V
		D = 12 V
		V = Isolation rating
		A = 1 kV <sub>RMS</sub>
		B = 2.5 kV <sub>RMS</sub>
Line 2 Marking: <sup>1</sup>		W = Dead-time setting range
		none = not included
		1= 10-200 ns
	WX = Ordering options	4 = 20-700 ns
		X = Integrated deglitch circuit
		none = not included
		D = integrated
	YY = Year	Assigned by the Assembly House. Corresponds to the year and workweek
	WW = Work week	of the mold date.
Line 3 Marking:	TTTTTT = Mfg code	Manufacturing Code from Assembly Purchase Order form.  The Manufacturing Code represented by "TTTTTT" contains, as its first character, a letter in the range N through Z to indicate Automotive-Grade.

# Note:

1. Characters W and/or X are optional and may be missing from the marking line. When missing, the remaining characters are right-justified on the marking line.

# 8.3 Si827x Top Marking (14-Pin DFN)

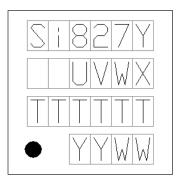

Table 8.3. Top Marking Explanation (14-Pin DFN)

Line 1 Marking:  Line 2 Marking:1	Base Part Number Ordering Options See 1. Ordering Guide for more information.  Ordering Options	Si827 = ISOdriver product series  Y = configuration  3 = High-side/Low-side (HS/LS)  4 = PWM HS/LS  5 = Dual driver  U = UVLO level  G = 3 V  A = 5 V  B = 8 V  D = 12 V  V = Isolation rating  A = 1 kV <sub>RMS</sub> B = 2.5 kV <sub>RMS</sub> W = Dead-time setting range  none = not included  1 = 10-200 ns  4 = 20-700 ns  X = Integrated deglitch circuit  none = not included  D = integrated
Line 3 Marking:	TTTTTT = Mfg code	D = integrated  Manufacturing Code from Assembly Purchase Order form.  The Manufacturing Code represented by "TTTTTT" contains, as its first character, a letter in the range N through Z to indicate Automotive-Grade.
Line 4 Marking:	Circle = 1.5 mm diameter YYWW	Pin 1 identifier.  Manufacturing date code.

# Note:

1. Characters W and/or X are optional and may be missing from the marking line. When missing, the remaining characters are right-justified on the marking line.

# 9. Revision History

#### Revision 1.06

April, 2021

· Added automotive-grade ordering part numbers to 1. Ordering Guide.

#### Revision 1.05

September, 2020

· Added Si8271GB-AS to 1. Ordering Guide.

### Revision 1.04

May, 2020

- · Adjusted industrial ordering guide to group by isolation rating.
- Added 8 new OPNs rated at 1 kV<sub>RMS</sub> to the Table 1.1 on page 2.
- Added Si8273GB-IM1 to Table 1.1 on page 2.
- Added footnotes section to Table 1.1 on page 2 and appropriate footnotes.
- Removed duplicate Si8273BB-IS1 line in the Table 1.1 on page 2.
- The QFN package was renamed to DFN throughout the document and pin count naming was unified with SOIC packages.
- · Updated and unified style and naming conventions throughout the document.
- Edited CQC basic working voltage rating from 600 V to 250 V and removed the reinforced working voltage rating in Table 4.2 on page 25.
- Edited Table 4.8 on page 30 and clarified negative transient tolerance specification.
- Edited the Top Marking Explanation tables in 8. Top Markings and added a footnote clarifying how optional characters are represented.
- Removed "component notice 5A" from CSA certification descriptions in Table 4.2 on page 25.
- Added "-2011" to CQC certification descriptions in Table 4.2 on page 25.
- Corrected Dead-Time Adjustable Range on Si8274DB1-AS1 to 10-100 ns in Table 1.1 on page 2.
- · Updated diagrams in 2. System Overview to improve readability.
- · Updated application diagrams in 3. Applications to improve readability and to follow updated naming conventions.
- Corrected IC Junction-to-Air Thermal Resistance (Ø<sub>JA</sub>) specifications for all packages in Table 4.7 on page 28.
- Clarified Figure 4.1 on page 24, Figure 4.2 on page 24, and Figure 4.3 on page 25.
- Updated thermal derating curves, power dissipation example, and safety input current specifications and test conditions for all packages based on new Ø<sub>JA</sub> specifications.
- Added a new thermal derating curve for the DFN-14 package (Figure 4.6 on page 29) based on the new Ø<sub>JA</sub> specification.
- · Clarified, reorganized, and updated the 2.4 Power Dissipation Considerations section.
- Figure 6.3 on page 38 and Table 6.3 on page 38 were edited and clarified.
- Footnote 3 was removed from Table 6.3 on page 38.
- Removed the single driver option from Line 1 Marking row in Table 8.3 on page 44
- · Reorganized and clarified 2.7 Overlap Protection and Programmable Dead Time
- Clarified conditions for typical specifications in Table 4.1 Electrical Characteristics on page 21

### Revision 1.03

October, 2019

Added Si8275BB-AS1 and Si8275GB-AS1 to Ordering Guide for Automotive Grade OPNs.

#### Revision 1.02

June. 2019

Updated Table 1.1 Si827x Ordering Guide<sup>1, 2, 3</sup> on page 2.

### Revision 1.01

April, 2019

Added Si8271AB-AS and Si8274BB4D-AS1 to Ordering Guide for Automotive Grade OPNs.

#### **Revision 1.0**

May, 2018

- Replaced references and descriptions of LGA package with QFN package throughout the data sheet.
- Updated OPNs with LGA package denoted by -IM suffix to QFN packages denoted by -IM1 suffix in the Ordering Guide.
- Added Si8274DB1-AS1 OPN to Ordering Guide for Automotive Grade OPNs.
- Added Note 6 to Ordering Guide for Automotive Grade OPNs referring to Top Markings for Automotive Grade parts.
- Updated Equation 3 and the chart generated by Equation 3 in Figure 2.17 Max Load vs. Switching Frequency on page 15.
- · Corrected power dissipation example calculations in Power Dissipation Considerations.
- Updated Package Outline: 14 LD QFN with new QFN package outline drawing and updated Table 6.3 Package Diagram Dimensions on page 38 with QFN package dimensions.
- Updated Table 4.2 Regulatory Information on page 25 with certification information.
- Updated Table 4.3 Insulation and Safety-Related Specifications on page 26 symbols and clarified parameters.
- Added Surge Voltage specification to Table 4.5 VDE 0884 Insulation Characteristics on page 27.
- Updated description of Figure 4.5 NB SOIC-16, QFN-14 Thermal Derating Curve on page 28 and Figure 4.4 NB SOIC-8 Thermal Derating Curve on page 28.

### Revision 0.6

December, 2017

- Updated Figure 2.12 Rise/Fall Time vs. Load on page 10.
- Updated Table 4.1 Electrical Characteristics on page 21.
  - · Added "(no load)" under IDDx specification test condition.
  - Added t<sub>SD</sub> and t<sub>RESTART</sub> specs.
- Corrected storage temp and power dissipation for SOIC-8 package in Table 4.6 IEC Safety Limiting Values<sup>1</sup> on page 27.
- Added footnote about VO+ and VOA/VOB voltages with respect to ground in Table 4.8 Absolute Maximum Ratings<sup>1</sup> on page 30 with improvement from other pins.
- · Added new table to Ordering Guide for Automotive-Grade OPN options.

#### Revision 0.5

February, 2016

Initial release.
