Pin Assignment

(1) TO252-3L

(2) TO263-3L

(3) TO220-3L

Pin Description

Pin Name	I/O	Pin #	Description
Adj (GND)	I	1	Adjustable (Ground only for fixed mode) A resistor divider from this pin to the V_{OUT} pin and ground sets the output voltage (Ground only for Fixed-Mode).
V_{OUT}	O	2	The output of the regulator. A minimum of 10uF ($0.15\Omega \leq ESR \leq 20\Omega$) capacitor must be connected from this pin to ground to insure stability.
V_{IN}	I	3	The input pin of regulator. Typically a large storage capacitor is connected from this pin to ground to insure that the input voltage does not sag below the minimum dropout voltage during the load transient response. This pin must always be 1.4V (1.3V) higher than V_{OUT} in order for the device to regulate properly.

Block Diagram

Absolute Maximum Ratings

Symbol	Parameter	Rating	Unit
V_{IN}	DC Supply Voltage	-0.3 to 12	V
T_{ST}	Storage Temperature	-65 to +150	$^{\circ}\text{C}$
T_{MJ}	Maximum Junction Temperature	150	$^{\circ}\text{C}$

Recommended Operating Conditions

Symbol	Parameter	Min	Max	Unit
T_{OP}	Operating Junction Temperature Range	0	125	$^{\circ}\text{C}$

Electrical Characteristics (Under Operating Conditions)

Symbol	Parameter	Conditions	Min	Typ.	Max	Unit
V_{REF}	Reference Voltage	$I_O = 10\text{mA}$, $T_A = 25^\circ\text{C}$, $(V_{IN} - V_{OUT}) = 1.5\text{V}$	1.225	1.250	1.275	V
Line Regulation	AP1084-XXX	$I_O = 10\text{mA}$, $V_{OUT} + 1.5\text{V} < V_{IN} < 12\text{V}$, $T_A = 25^\circ\text{C}$			0.2	%
	AP1084-1.5	$I_{OUT} = 10\text{mA}$, $T_A = 25^\circ\text{C}$, $3\text{V} \leq V_{IN} \leq 12\text{V}$	1.470	1.500	1.530	V
	AP1084-1.8	$I_{OUT} = 10\text{mA}$, $T_A = 25^\circ\text{C}$, $3.3\text{V} \leq V_{IN} \leq 12\text{V}$	1.764	1.800	1.836	V
	AP1084-2.5	$I_{OUT} = 10\text{mA}$, $T_A = 25^\circ\text{C}$, $4\text{V} \leq V_{IN} \leq 12\text{V}$	2.450	2.500	2.550	V
	AP1084-3.3	$I_{OUT} = 10\text{mA}$, $T_A = 25^\circ\text{C}$, $4.8\text{V} \leq V_{IN} \leq 12\text{V}$	3.235	3.300	3.365	V

Load Regulation	AP1084-Adj	$V_{IN} = 3.3\text{V}$, $0\text{mA} < I_O < 5\text{A}$, $T_A = 25^\circ\text{C}$			1	%
	AP1084-1.5	$V_{IN} = 3\text{V}$, $0\text{mA} < I_O < 5\text{A}$, $T_A = 25^\circ\text{C}$ (Note 3, 4)		12	15	mV
	AP1084-1.8	$V_{IN} = 3.3\text{V}$, $0\text{mA} < I_O < 5\text{A}$, $T_A = 25^\circ\text{C}$ (Note 3, 4)		15	18	mV
	AP1084-2.5	$V_{IN} = 4\text{V}$, $0\text{mA} < I_O < 5\text{A}$, $T_A = 25^\circ\text{C}$ (Note 3, 4)		20	25	mV
	AP1084-3.3	$V_{IN} = 5\text{V}$, $0\text{mA} < I_O < 5\text{A}$, $T_A = 25^\circ\text{C}$ (Note 3, 4)		26	33	mV
	AP1084-5.0	$V_{IN} = 8\text{V}$, $0\text{mA} < I_O < 5\text{A}$, $T_A = 25^\circ\text{C}$ (Note 3, 4)		40	50	mV
ΔV_O	Dropout Voltage	$I_O = 5.0\text{A}$ ($\Delta V_{OUT} = 1\% V_{OUT}$)		1.3	1.4	V
	Current Limit	$V_{IN} - V_{OUT} = 5\text{V}$	5.1			A
	Minimum Load Current			5	10	mA
	Temperature Stability	$I_O = 10\text{mA}$		0.5		%
T_{SD}	Thermal Shutdown Temperature			150		$^\circ\text{C}$
θ_{JA}	Thermal Resistance Junction-to-Ambient (Note 5)	TO220-3L		78		$^\circ\text{C/W}$
		TO252-3L		73		
		TO263-3L		60		
θ_{JC}	Thermal Resistance Junction-to-Case (Note 5)	TO220-3L:Control Circuitry/Power Transistor		3.5		$^\circ\text{C/W}$
		TO252-3L:Control Circuitry/Power Transistor		12		
		TO263-3L:Control Circuitry/Power Transistor		3.5		

- Notes:
- See thermal regulation specifications for changes in output voltage due to heating effects. Line and load regulation are measured at a constant junction temperature by low duty cycle pulse testing. Load regulation is measured at the output lead = 1/18" from the package.
 - Line and load regulation are guaranteed up to the maximum power dissipation of 15W. Power dissipation is determined by the difference between input and output and the output current. Guaranteed maximum power dissipation will not be available over the full input/output range.
 - Test conditions for TO220-3L, TO252-3L and TO263-3L: Devices mounted on FR-4 substrate, single sided PC board, 2oz copper, with minimum recommended pay layout, no air flow. The case point of θ_{JC} is located on the thermal tab.

Functional Description

Introduction

The AP1084 adjustable Low Dropout (LDO) regulator is a 3 terminal device that can easily be programmed with the addition of two external resistors to any voltages within the range of 1.25V to $V_{IN}-1.4V$. The AP1084 only needs 1.4V differential between V_{IN} and V_{OUT} to maintain output regulation. In addition, the output voltage tolerances are also extremely tight and they include the transient response as part of the specification. For example, Intel VRE specification calls for a total of +/- 100mV including initial tolerance, load regulation and 0 to 5.0A load step.

The AP1084 is specifically designed to meet the fast current transient needs as well as providing an accurate initial voltage, reducing the overall system cost with the need for fewer output capacitors.

Output Voltage Setting

The AP1084 can be programmed to any voltages in the range of 1.25V to $V_{IN}-1.4V$ with the addition of R1 and R2 external resistors according to the following formula:

The AP1084 keeps a constant 1.25V between the output pin and the adjust pin. By placing a resistor R1 across these two pins a constant current flows through R1, adding to the I_{adj} current and into the R2 resistor producing a voltage equal to the $(1.25/R1)*R2 + I_{adj}*R2$ which will be added to the 1.25V to set the output voltage. This is summarized in the above equation. Since the minimum load current requirement of the AP1084 is 10mA, R1 is typically selected to be 121Ω resistor so that it automatically satisfies the minimum current requirement. Notice that since I_{adj} is typically in the range of 55uA it only adds a small error to the output voltage and should only be considered when a very precise output voltage setting is required. For example, in a typical 3.3V application where $R1=121\Omega$ and $R2=200\Omega$ the error due to I_{adj} is only 0.3% of the nominal set point.

Load Regulation

Since the AP1084 is only a 3 terminal device, it is not possible to provide true remote sensing of the output voltage at the load. The best load regulation is achieved when the bottom side of R2 is connected to the load and the top-side of R1 resistor is connected directly to the case or the V_{OUT} pin of the regulator and not to the load. It is important to note that for high current applications, this can re-present a significant percentage of the overall load regulation and one must keep the path from the regulator to the load as short as possible to minimize this effect.

Stability

The AP1084 requires the use of an output capacitor as part of the frequency compensation in order to make the regulator stable. For most applications a minimum of 10uF aluminum electrolytic capacitor insures both stability and good transient response.

Thermal Design

The AP1084 incorporates an internal thermal shutdown that protects the device when the junction temperature exceeds the maximum allowable junction temperature. Although this device can operate with junction temperatures in the range of **150°C**, it is recommended that the selected heat sink be chosen such that during maximum continuous load operation the junction temperature is kept below that temperature.

Layout Consideration

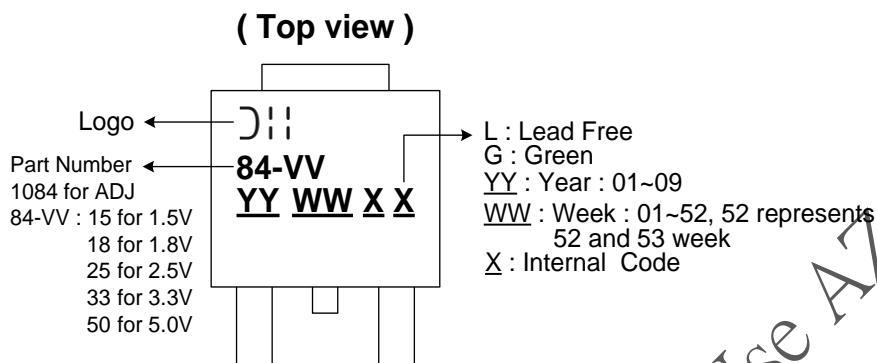

The output capacitors must be located as close to the V_{OUT} terminal of the device as possible. It is recommended to use a section of a layer of the PC board as a plane to connect the V_{OUT} pin to the output capacitors to prevent any high frequency oscillation that may result due to excessive trace inductance.

Typical Performance Characteristics

Marking Information

(1) TO252-3L

(2) TO263-3L

(3) TO220-3L

Package Information (All Dimensions in mm)

(1) Package type: TO252-3L

(2) Package type: TO263-3L

Package Information (Continued)

(3) Package type: TO220-3L

Diodes Incorporated does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel.

Should Customers purchase or use Diodes Incorporated products for any unintended or unauthorized application, Customers shall indemnify and hold Diodes Incorporated and its representatives harmless against all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized application.

Products described herein may be covered by one or more United States, international or foreign patents pending. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
