

Applications

The AS1383 is ideal for space critical applications where small size is mandatory as in USB or portable HDMI applications, mobile phones, PDAs, portable media players or digital cameras.

Pin Assignment

Figure 4:
Pin Assignment for WL-CSP

Pin Assignments: Shows the TOP view pin assignment of the AS1383.

Figure 5:
Pin Description

Pin Number	Pin Name	Description
A1	VIN	Input Voltage. The AS1383 gets its start-up bias from VIN unless VOUT exceeds VIN, in which case the bias is derived from VOUT. Thus, once started, operation is completely independent from VIN. Operation is only limited by the output power level and the internal series resistance of the supply.
A2	GND	Signal and Power Ground
B1	SW	Switch Pin. Connect an inductor between this pin and VIN. Keep the PCB trace lengths as short and wide as is practical to reduce EMI and voltage overshoot. If the inductor current falls to zero, or pin EN is low, an internal 100Ω anti-ringing switch is connected from this pin to VIN to minimize EMI. ⁽¹⁾
B2	VOUT	Output Voltage. Bias is derived from VOUT when VOUT exceeds VIN. PCB trace length from VOUT to the output filter capacitor(s) should be as short and wide as is practical.
C1	EN	Active-High Enable Input. A logic LOW reduces the supply current to < 1μA. Connect to pin VIN for normal operation.
C2	FB	Feedback Pin. Feedback input to the gm error amplifier, connect this pin to VOUT

Note(s) and/or Footnote(s):

1. An optional Schottky diode can be connected between this pin and VOUT.

Absolute Maximum Ratings

Stresses beyond those listed under [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under [Electrical Characteristics](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 6:
Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Units	Comments
Electrical Parameters					
V _{GND}	All pins to GND	-0.3	V _{OUT} + 0.3	V	
I _{SCR}	Input Current (latch-up immunity)	-100	100	mA	Norm: JEDEC 78

I_{EN}	EN Input Current	Internal pull-down resistor		0.01	1.0	μA
Thermal Protection						
	Thermal shutdown	10°C Hysteresis - Thermal protection stops switching, supply disconnect not supported		150		°C

Detailed Descriptions

The AS1383 can operate from 2.7V to 5.5V and features fixed frequency (3.5MHz) and current mode PWM control for exceptional line- and load regulation. With low $R_{DS(ON)}$ and gate charge internal NMOS and PMOS switches, the device maintains high-efficiency from light to heavy loads.

Modern portable devices frequently spend extended time in low-power or standby modes, switching to high power-drain only when certain functions are enabled. The AS1383 is ideal for portable devices since it maintain high-power conversion efficiency over a wide output power range, thus increasing battery life in these types of devices.

In addition to high-efficiency at moderate and heavy loads, the AS1383 includes an automatic powersave mode that improves efficiency of the power converter at light loads. The powersave mode is initiated if the output load current falls below a factory programmed threshold.

Figure 8:
AS1383 Block Diagram

Low-Noise Fixed-Frequency Operation

Oscillator

The AS1383 switching frequency is internally fixed at 3.5MHz allowing the use of very small external components.

Current Sensing

A signal representing the internal NMOS-switch current is summed with the slope compensator. The summed signal is compared to the error amplifier output to provide a peak current control command for the PWM. Peak switch current is limited to approximately 650mA independent of V_{IN} or V_{OUT} .

Zero Current Comparator

The zero current comparator monitors the inductor current to the output and shuts off the PMOS synchronous rectifier once this current drops to 20mA (approx.). This prevents the inductor current from reversing polarity and results in improved converter efficiency at light loads.

Anti-Ringing Control

Anti-ringing control circuitry prevents high-frequency ringing on pin SW as the inductor current approaches zero. This is accomplished by damping the resonant circuit formed by the inductor and the capacitance on pin SW (CSW).

Powersave Operation

In light load conditions, the integrated powersave feature removes power from all circuitry not required to monitor V_{OUT} . When V_{OUT} has dropped approximately 1% from nominal, the device powers up and begins normal PWM operation.

C2 recharges, causing the AS1383 to re-enter powersave mode as long as the output load remains below the powersave threshold. The frequency of this intermittent PWM is proportional to load current; i.e., as the load current drops further below the powersave threshold, the AS1383 turns on less frequently. When the load current increases above the powersave threshold, the AS1383 will resume continuous, seamless PWM operation.

Shutdown

When pin EN is low the AS1383 is switched off and $<1\mu A$ current is drawn from the battery; when pin EN is high the device is switched on. If EN is driven from a logic-level output, the logic high-level (on) should be referenced to V_{OUT} to avoid intermittently switching the device on. In shutdown the battery input is disconnected from the output.

Thermal Overload Protection

To prevent the AS1383 from short-term misuse the chip includes a thermal overload protection. To block the normal operation the switching of PMOS and NMOS are stopped during the thermal protection, but the V_{OUT} follows the V_{BAT} . The device is in thermal shutdown when the junction temperature exceeds 150°C. To resume the normal operation the temperature has to drop below 140°C.

Note(s): Continuing operation in thermal overload conditions may damage the device and is considered bad practice.

 V_{OUT} Programming with External Resistor Divider

In adjustable V_{OUT} variant AS1383 output voltage can be selected with external resistor divider connected to the FB pin as shown in [Figure 3](#). In this case, the V_{OUT} follows the function:

$$(EQ1) \quad V_{OUT} = \left(1 + \frac{R_1}{R_2}\right) \cdot 1.25V$$

In fixed output voltage variant the V_{OUT} is programmed internally, and the V_{OUT} if connected directly to FB pin.

A higher resistance of R1 and R2 will result in a lower leakage current. Resistance between 10kΩ and 500kΩ is recommended for R2. It is recommended to keep V_{IN} 500mV higher than V_{OUT} .

Typical Operating Characteristics

The following figures are summarizing the AS1383 efficiency as function of load current and input voltage.

Figure 9:
AS1383 Efficiency vs. Load Current

AS1383 Efficiency vs. Input Voltage ($V_{OUT} = 5.0V$, $I_{LOAD} = 100mA$)

Figure 11:
V_{OUT} Behavior When V_{IN} is Stepped Between 3.0V and 3.5V (I_{LOAD}=100mA, V_{OUT} = 5.0V)

Figure 12:
V_{OUT} Behavior When V_{IN} is Stepped Between 3.0V and 3.5V (I_{LOAD}=100mA, V_{OUT} = 4.5V)

External Component Selection

An external inductor (L) and two capacitors (C_{IN} and C_{OUT}) are needed for the AS1383 functionality. With the adjustable variant also two external resistors are needed to program the V_{OUT} voltage. This section gives recommendations for the components to be used.

Inductor Selection

Figure 13:
Recommended Inductors

Part Number	L	DCR	Current Rating	Dimensions in mm (L / W / H)	Manufacturer
CIG22H1R0MAE	1 μ H	65m Ω	1.8A	2.5 x 2.0 x 1.0	www.samsungsem.com
XFL4020-102	1 μ H	11.9m Ω	11A	4.3 x 4.3 x 2.1	www.coilcraft.com
DFE201610E	1 μ H	96m Ω	2.2A	2.0 x 1.6 x 1.0	www.toko.co.jp
LQM18PW1R0MCH	1 μ H	288m Ω	0.95A	1.6 x 0.8 x 0.5	www.murata.com

Capacitor Selection

When choosing ceramic capacitors for C_{IN} and C_{OUT} , the X5R or X7R dielectric formulations are recommended. These dielectrics have the best temperature and voltage characteristics for a given value and size. Y5V and Z5U dielectric capacitors, aside from their wide variation in capacitance over temperature, become resistive at high frequencies and therefore should not be used.

Note that the last components in the tables are the ones that are used in the evaluation board instead of the smallest possible components.

Figure 14:
Recommended C_{IN} Capacitors

Part Number	C	TC Code	Voltage Rating	Dimensions in mm (L / W / H)	Manufacturer
GRM219R61A106ME47	10 μ F	X5R	10V	2.0 x 1.2 x 1.25	www.murata.com
CL10A106KP8NNNC	10 μ F	X5R	10V	1.6 x 0.8 x 0.8mm	www.samsungsem.com

Figure 15:
Recommended C_{OUT} Capacitors

Part Number	C	TC Code	Voltage Rating	Dimensions in mm (L/W/H)	Manufacturer
GRM21BR61E475MA12	4.7μF	X5R	25V	2.0 x 1.2 x 1.25	www.murata.com
GRM219R61A106ME47	10μF	X5R	10V	2.0 x 1.2 x 1.25	www.murata.com
CL10A475KP8NNNC	4.7μF	X5R	10V	1.6 x 0.8 x 0.8mm	www.samsungsem.com
CL10A106KP8NNNC	10μF	X5R	10V	1.6 x 0.8 x 0.8mm	www.samsungsem.com

Because ceramic capacitors lose a lot of their initial capacitance at their maximum rated voltage, it is recommended that either a higher input capacity or a capacitance with a higher rated voltage is used.

Feedback Resistor Selection

Layout Recommendation

The high-speed operation of the AS1383 requires proper layout for optimum performance. Figure 16 shows the recommended component layout.

- A large ground pin copper area will help to lower the device temperature.
- A multi-layer board with a separate ground plane is recommended.
- Traces carrying large currents should be direct.
- Trace area at pin FB should be as small as is practical.
- The lead-length to the battery should be as short as is practical.

Ordering & Contact Information

The figure below shows the ordering codes for Tape & Reel deliveries (suffix **T** in the ordering code). It is also possible to have all the variants on mini reels, when the ordering codes are AS1383-BWLM-xx (where suffix **M** stands for a mini reel). The components are the same in both reel sizes.

Figure 19:
Ordering Information

Ordering Code	V _{OUT}	Delivery Form	Package
AS1383-BWLT-ES	-	Tape & Reel	WL-CSP
AS1383-BWLT-AD	Adjustable	Tape & Reel	WL-CSP
AS1383-BWLT-45	4.5V	Tape & Reel	WL-CSP
AS1383-BWLT-xx		Tape & Reel	WL-CSP
AS1383-BWLT-50	5.0V	Tape & Reel	WL-CSP

RoHS Compliant & ams Green Statement

RoHS: The term RoHS compliant means that ams AG products fully comply with current RoHS directives. Our semiconductor products do not contain any chemicals for all 6 substance categories, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, RoHS compliant products are suitable for use in specified lead-free processes.

ams Green (RoHS compliant and no Sb/Br): ams Green defines that in addition to RoHS compliance, our products are free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).

Important Information: The information provided in this statement represents ams AG knowledge and belief as of the date that it is provided. ams AG bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ams AG has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams AG and ams AG suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
