Application Information

General Description

The CLCx011 family of amplifiers are single supply, general purpose, voltage-feedback amplifiers. They are fabricated on a complimentary bipolar process, feature a rail-to-rail input and output, and are unity gain stable.

Basic Operation

Figures 1, 2, and 3 illustrate typical circuit configurations for non-inverting, inverting, and unity gain topologies for dual supply applications. They show the recommended bypass capacitor values and overall closed loop gain equations. Figure 4 shows the typical non-inverting gain circuit for single supply applications.

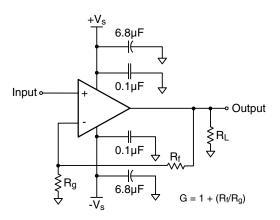

Figure 1: Typical Non-Inverting Gain Circuit

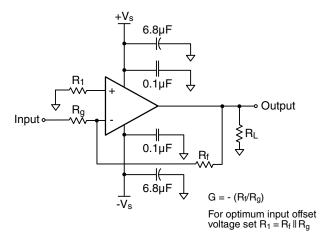

Figure 2: Typical Inverting Gain Circuit

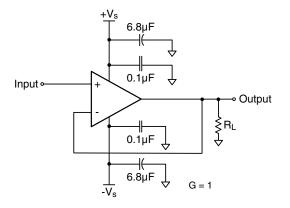

Figure 3: Unity Gain Circuit

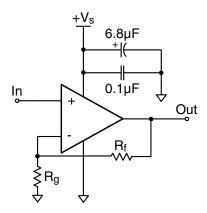

Figure 4: Single Supply Non-Inverting Gain Circuit

Power Dissipation

Power dissipation should not be a factor when operating under the stated $10k\Omega$ load condition. However, applications with low impedance, DC coupled loads should be analyzed to ensure that maximum allowed junction temperature is not exceeded. Guidelines listed below can be used to verify that the particular application will not cause the device to operate beyond it's intended operating range.

Maximum power levels are set by the absolute maximum junction rating of 150°C. To calculate the junction temperature, the package thermal resistance value Theta_JA (θ_{JA}) is used along with the total die power dissipation.

$$T_{Junction} = T_{Ambient} + (\theta_{JA} \times P_D)$$

Where T_{Ambient} is the temperature of the working environment.

In order to determine P_D , the power dissipated in the load needs to be subtracted from the total power delivered by the supplies.

$$P_D = P_{supply} - P_{load}$$

Supply power is calculated by the standard power equation.

$$P_{\text{supply}} = V_{\text{supply}} \times I_{\text{RMSsupply}}$$

$$V_{\text{supply}} = V_{\text{S-}} + V_{\text{S-}}$$

Power delivered to a purely resistive load is:

$$P_{load} = ((V_{load})_{RMS^2})/Rload_{eff}$$

The effective load resistor (Rload $_{\rm eff}$) will need to include the effect of the feedback network. For instance, Rload $_{\rm eff}$ in Figure 3 would be calculated as:

$$R_L \parallel (R_f + R_g)$$

These measurements are basic and are relatively easy to perform with standard lab equipment. For design purposes however, prior knowledge of actual signal levels and load impedance is needed to determine the dissipated power. Here, P_D can be found from

Quiescent power can be derived from the specified $I_{\rm S}$ values along with known supply voltage, V_{supply} . Load power can be calculated as above with the desired signal amplitudes using:

$$(V_{load})_{RMS} = V_{peak} / \sqrt{2}$$

 $(I_{load})_{RMS} = (V_{load})_{RMS} / Rload_{eff}$

The dynamic power is focused primarily within the output stage driving the load. This value can be calculated as:

$$P_{Dvnamic} = (V_{S+} - V_{load})_{RMS} \times (I_{load})_{RMS}$$

Assuming the load is referenced in the middle of the power rails or $V_{\text{supply}}/2$.

The CLC2011 is short circuit protected. However, this may not guarantee that the maximum junction temperature (+150°C) is not exceeded under all conditions. Figure 5 shows the maximum safe power dissipation in the package vs. the ambient temperature for the packages available.

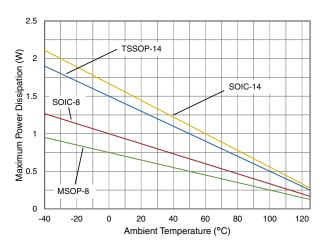

Figure 5. Maximum Power Derating

Input Common Mode Voltage

The common mode input range extends to 250mV below ground and to 250mV above Vs, in single supply operation. Exceeding these values will not cause phase reversal. However, if the input voltage exceeds the rails by more than 0.5V, the input ESD devices will begin to conduct. The output will stay at the rail during this overdrive condition. If the absolute maximum input voltage (700mV beyond either rail) is exceeded, externally limit the input current to ±5mA as shown in Figure 6.

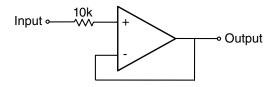

Figure 6. Circuit for Input Current Protection

Driving Capacitive Loads

Increased phase delay at the output due to capacitive loading can cause ringing, peaking in the frequency response, and possible unstable behavior. Use a series resistance, R_S , between the amplifier and the load to help improve stability and settling performance. Refer to Figure 7.

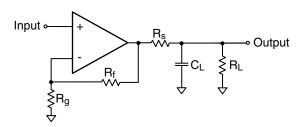

Figure 7. Addition of R_S for Driving Capacitive Loads

Table 1 provides the recommended $R_{\rm S}$ for various capacitive loads. The recommended $R_{\rm S}$ values result in approximately <1dB peaking in the frequency response. The Frequency Response vs. CL plot, on page 6, illustrates the response of the CLCx011.

| C _L (pF) | R _S (Ω) | -3dB BW (MHz) |
|---------------------|--------------------|---------------|
| 10pF | 0 | 2.2 |
| 20pF | 0 | 2.4 |
| 50pF | 0 | 2.5 |
| 100pF | 100 | 2 |

Table 1: Recommended R_S vs. C_L

For a given load capacitance, adjust R_S to optimize the tradeoff between settling time and bandwidth. In general, reducing R_S will increase bandwidth at the expense of additional overshoot and ringing.

Overdrive Recovery

An overdrive condition is defined as the point when either one of the inputs or the output exceed their specified voltage range. Overdrive recovery is the time needed for the amplifier to return to its normal or linear operating point. The recovery time varies, based on whether the input or output is overdriven and by how much the range is exceeded. The CLCx011 will typically recover in less than 50ns from an overdrive condition. Figure 8 shows the CLC2011 in an overdriven condition.

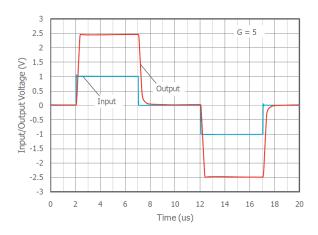

Figure 8: Overdrive Recovery

Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. Resurgent has evaluation boards to use as a guide for high frequency layout and as an aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8µF and 0.1µF ceramic capacitors for power supply decoupling
- Place the 6.8µF capacitor within 0.75 inches of the power pin
- Place the 0.1µF capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts below for more information.

Evaluation Board Information

The following evaluation boards are available to aid in the testing and layout of these devices:

| Evaluation Board # | Products |
|--------------------|------------------|
| CEB006 | CLC2011 in SOIC |
| CEB010 | CLC2011 in MSOP |
| CEB019 | CLC4011 in TSSOP |
| CEB018 | CLC4011 in SOIC |

Evaluation Board Schematics

Evaluation board schematics and layouts are shown in Figures 9-16 These evaluation boards are built for dual-supply operation. Follow these steps to use the board in a single-supply application:

- 1. Short -V_S to ground.
- Use C3 and C4, if the -V_S pin of the amplifier is not directly connected to the ground plane.

|----------------------------------|------------------|-------|-----------------------------|------------------|--|--|
| CLC2011 Ordering Information | | | | | | |
| CLC2011ISO8X | SOIC-8 | Yes | -40°C to +125°C | Tape & Reel | | |
| CLC2011ISO8MTR | SOIC-8 | Yes | -40°C to +125°C | Mini Tape & Reel | | |
| CLC2011ISO8EVB | Evaluation Board | N/A | N/A | N/A | | |
| CLC2011IMP8X | MSOP-8 | Yes | -40°C to +125°C | Tape & Reel | | |
| CLC2011IMP8MTR | MSOP-8 | Yes | -40°C to +125°C | Mini Tape & Reel | | |
| CLC2011IMP8EVB | Evaluation Board | N/A | N/A | N/A | | |
| CLC4011 Ordering Information | | | | | | |
| CLC4011ISO14X | SOIC-14 | Yes | -40°C to +125°C | Tape & Reel | | |
| CLC4011ISO14MTR | SOIC-14 | Yes | -40°C to +125°C | Mini Tape & Reel | | |
| CLC4011ISO14EVB | Evaluation Board | N/A | N/A | N/A | | |
| CLC4011ITP14X | TSSOP-14 | Yes | -40°C to +125°C | Tape & Reel | | |
| CLC4011ITP14MTR TSSOP-14 | | Yes | -40°C to +125°C | Mini Tape & Reel | | |
| CLC4011ITP14EVB Evaluation Board | | N/A | N/A | N/A | | |

Moisture sensitivity level for all parts is MSL-1. Mini tape and reel quantity is 250.

Revision History

| Revision | Date | Description |
|------------------|---------------------|---|
| 1D (ECN 1504-01) | January 19, 2015 | Reformat into Exar data sheet template. Updated PODs and thermal resistance numbers. Updated ordering information table to include MTR and EVB part numbers. Increased operating temperature to +125°C. |
| 1D.R | July 2018 | Updated to Resurgent Semiconductor. |
