Pin Definitions

Left Port	Right Port	Description
A _{0L} –A _{17L}	A _{0R} –A _{17R}	Address inputs.
$\overline{\text{BE}}_{0L}$ – $\overline{\text{BE}}_{7L}$	$\overline{\text{BE}}_{0R}$ – $\overline{\text{BE}}_{7R}$	Byte enable inputs. Asserting these signals enables Read and Write operations to the corresponding bytes of the memory array.
$\overline{\text{BUSY}}_L^{[10,11]}$	$\overline{\text{BUSY}}_R^{[10,11]}$	Port busy output. When the collision is detected, a $\overline{\text{BUSY}}$ is asserted.
C _L	C _R	Input clock signal.
$\overline{\text{CE}}_{0L}^{[12]}$	$\overline{\text{CE}}_{0R}^{[12]}$	Active low chip enable input.
CE _{1L} ^[13]	CE _{1R} ^[13]	Active high chip enable input.
DQ _{0L} –DQ _{71L}	DQ _{0R} –DQ _{71R}	Data bus input/output.
$\overline{\text{OE}}_L$	$\overline{\text{OE}}_R$	Output enable input. This asynchronous signal must be asserted LOW to enable the DQ data pins during Read operations.
$\overline{\text{INT}}_L$	$\overline{\text{INT}}_R$	Mailbox interrupt flag output. The mailbox permits communications between ports. The upper two memory locations can be used for message passing. $\overline{\text{INT}}_L$ is asserted LOW when the right port writes to the mailbox location of the left port, and vice versa. An interrupt to a port is deasserted HIGH when it reads the contents of its mailbox.
$\overline{\text{LowSPD}}_L^{[10,14]}$	$\overline{\text{LowSPD}}_R^{[10,14]}$	Port low speed select input. When operating at less than 100 MHz, the $\overline{\text{LowSPD}}$ disables the port DLL.
PORTSTD _I [1:0] _L ^[10,14]	PORTSTD _I [1:0] _R ^[10,14]	Port address/control/data i/o standard select input.
R/ $\overline{\text{W}}_L$	R/ $\overline{\text{W}}_R$	Read/write enable input. Assert this pin LOW to write to, or HIGH to Read from the dual-port memory array.
$\overline{\text{READY}}_L^{[10,11]}$	$\overline{\text{READY}}_R^{[10,11]}$	Port ready output. This signal will be asserted when a port is ready for normal operation.
CNT/ $\overline{\text{MSK}}_L^{[13]}$	CNT/ $\overline{\text{MSK}}_R^{[13]}$	Port counter/mask select input. Counter control input.
$\overline{\text{ADS}}_L^{[12]}$	$\overline{\text{ADS}}_R^{[12]}$	Port counter address load strobe input. Counter control input.
$\overline{\text{CNTEN}}_L^{[12]}$	$\overline{\text{CNTEN}}_R^{[12]}$	Port counter enable input. Counter control input.
$\overline{\text{CNTRST}}_L^{[13]}$	$\overline{\text{CNTRST}}_R^{[13]}$	Port counter reset input. Counter control input.
$\overline{\text{CNTINT}}_L^{[15]}$	$\overline{\text{CNTINT}}_R^{[15]}$	Port counter interrupt output. This pin is asserted LOW when the unmasked portion of the counter is incremented to all “1s”.
$\overline{\text{WRP}}_L^{[10,16]}$	$\overline{\text{WRP}}_R^{[10,16]}$	Port counter wrap input. After the burst counter reaches the maximum count, if $\overline{\text{WRP}}$ is low, the unmasked counter bits will be set to 0. If high, the counter will be loaded with the value stored in the mirror register.
$\overline{\text{RET}}_L^{[10,16]}$	$\overline{\text{RET}}_R^{[11,16]}$	Port counter retransmit input. Counter control input.
$\overline{\text{FTSEL}}_L^{[10,16]}$	$\overline{\text{FTSEL}}_R^{[10,16]}$	Flow-through select. Use this pin to select Flow-Through mode. When is de-asserted, the device is in pipelined mode.
VREF _L ^[10,14]	VREF _R ^[10,14]	Port external high-speed io reference input.

Notes

16. Connect this ball to VDDIO. For more information about this next generation Dual-Port feature contact Cypress Sales.

Pin Definitions (continued)

Left Port	Right Port	Description
VDDIO _L	VDDIO _R	Port IO power supply.
REV ^[17,18] _L	REV ^[17,18] _R	Reserved pins for future features.
$\overline{\text{MRST}}$		Master reset input. $\overline{\text{MRST}}$ is an asynchronous input signal and affects both ports. A master reset operation is required at power-up.
TRST ^[17,19]		JTAG reset input.
TMS		JTAG test mode select input. It controls the advance of JTAG TAP state machine. State machine transitions occur on the rising edge of TCK.
TDI		JTAG test data input. Data on the TDI input will be shifted serially into selected registers.
TCK		JTAG test clock input.
TDO		JTAG test data output. TDO transitions occur on the falling edge of TCK. TDO is normally three-stated except when captured data is shifted out of the JTAG TAP.
V _{SS}		Ground inputs.
V _{CORE} ^[20]		Core power supply.
V _{TTL}		LVTTTL power supply.

Notes

17. This ball will represent a next generation Dual-Port feature. For more information about this feature, contact Cypress Sales.

18. Connect this ball to VSS. For more information about this next generation Dual-Port feature, contact Cypress Sales.

19. Leave this ball unconnected. For more information about this feature, contact Cypress Sales.

20. This family of Dual-Ports does not use V_{CORE}, and these pins are internally NC. The next generation Dual-Port family, the FLEx72-E™, will use V_{CORE} of 1.5 V or 1.8 V. Please contact local Cypress FAE for more information.

Master Reset

The FLEx72 family devices undergo a complete reset by taking the MRST input LOW. MRST input can switch asynchronously to the clocks. MRST initializes the internal burst counters to zero, and the counter mask registers to all ones (completely unmasked). MRST also forces the mailbox interrupt (INT) flags and the Counter Interrupt (CNTINT) flags HIGH. MRST must be performed on the FLEx72 family devices after power-up.

Mailbox Interrupts

The upper two memory locations may be used for message passing and permit communications between ports. Table 1 shows the interrupt operation for both ports using 18 Mbit device as an example. The highest memory location, 3FFFF is the mailbox for the right port and 3FFFE is the mailbox for the left port. Table 2 shows that in order to set the $\overline{\text{INT}}_{\text{R}}$ flag, a write

operation by the left port to address 3FFFF will assert $\overline{\text{INT}}_{\text{R}}$ LOW. At least one byte has to be active for a write to generate an interrupt. A valid Read of the 3FFFF location by the right port will reset $\overline{\text{INT}}_{\text{R}}$ HIGH. At least one byte has to be active in order for a read to reset the interrupt. When one port writes to the other port's mailbox, the INT of the port that the mailbox belongs to is asserted LOW.

The $\overline{\text{INT}}$ is reset when the owner (port) of the mailbox reads the contents of the mailbox. The interrupt flag is set in a flow-thru mode (i.e., it follows the clock edge of the writing port). Also, the flag is reset in a flow-thru mode (i.e., it follows the clock edge of the reading port).

Each port can read the other port's mailbox without resetting the interrupt. And each port can write to its own mailbox without setting the interrupt. If an application does not require message passing, INT pins should be left open.

Table 1. Interrupt Operation Example [21, 22, 23, 24]

Function	Left Port				Right Port			
	$\overline{\text{R}}/\overline{\text{W}}_{\text{L}}$	$\overline{\text{CE}}_{\text{L}}$	$\text{A}_{0\text{L}-17\text{L}}$	$\overline{\text{INT}}_{\text{L}}$	$\overline{\text{R}}/\overline{\text{W}}_{\text{R}}$	$\overline{\text{CE}}_{\text{R}}$	$\text{A}_{0\text{R}-17\text{R}}$	$\overline{\text{INT}}_{\text{R}}$
Set Right $\overline{\text{INT}}_{\text{R}}$ Flag	L	L	3FFFF	X	X	X	X	L
Reset Right $\overline{\text{INT}}_{\text{R}}$ Flag	X	X	X	X	H	L	3FFFF	H
Set Left $\overline{\text{INT}}_{\text{L}}$ Flag	X	X	X	L	L	L	3FFFE	X
Reset Left $\overline{\text{INT}}_{\text{L}}$ Flag	H	L	3FFFE	H	X	X	X	X

Notes

21. CYD09S72V have 17 address bits and CYD18S72V have 18 bits.

22. $\overline{\text{CE}}$ is internal signal. $\overline{\text{CE}} = \text{LOW}$ if $\overline{\text{CE}}_0 = \text{LOW}$ and $\overline{\text{CE}}_1 = \text{HIGH}$. For a single Read operation, $\overline{\text{CE}}$ only needs to be asserted once at the rising edge of the CLK and can be deasserted after that. Data will be out after the following CLK edge and will be three-stated after the next CLK edge.

23. $\overline{\text{OE}}$ is "Don't Care" for mailbox operation.

24. At least one of BE0 or BE7 must be LOW.

Table 2. Address Counter and Counter Mask Register Control Operation (Any Port) ^[25,26]

CLK	MRST	CNT/MSK	CNTRST	ADS	CNTEN	Operation	Description
X	L	X	X	X	X	Master Reset	Reset address counter to all 0s and mask register to all 1s
	H	H	L	X	X	Counter Reset	Reset counter unmasked portion to all 0s
	H	H	H	L	L	Counter Load	Load counter with external address value presented on address lines
	H	H	H	L	H	Counter Readback	Read out counter internal value on address lines
	H	H	H	H	L	Counter Increment	Internally increment address counter value
	H	H	H	H	H	Counter Hold	Constantly hold the address value for multiple clock cycles
	H	L	L	X	X	Mask Reset	Reset mask register to all 1s
	H	L	H	L	L	Mask Load	Load mask register with value presented on the address lines
	H	L	H	L	H	Mask Readback	Read out mask register value on address lines
	H	L	H	H	X	Reserved	Operation undefined

Address Counter and Mask Register Operations^[27]

This section describes the features only apply to 9-Mbit devices, not to 18 Mbit device. Each port has a programmable burst address counter. The burst counter contains three registers: a counter register, a mask register, and a mirror register.

The **counter register** contains the address used to access the RAM array. It is changed only by the Counter Load, Increment, Counter Reset, and by master reset (MRST) operations.

The **mask register** value affects the Increment and Counter Reset operations by preventing the corresponding bits of the counter register from changing. It also affects the counter interrupt output (CNTINT). The mask register is changed only by the Mask Load and Mask Reset operations, and by the MRST. The mask register defines the counting range of the counter register. It divides the counter register into two regions: zero or more "0s" in the most significant bits define the masked region, one or more "1s" in the least significant bits define the unmasked region. Bit 0 may also be "0," masking the least significant counter bit and causing the counter to increment by two instead of one.

The **mirror register** is used to reload the counter register on increment operations (see "retransmit," below). It always contains the value last loaded into the counter register, and is changed only by the Counter Load, and Counter Reset operations, and by the MRST.

Table 2 summarizes the operation of these registers and the required input control signals. The MRST control signal is asynchronous. All the other control signals in Table 2 (CNT/MSK, CNTRST, ADS, CNTEN) are synchronized to the

port's CLK. All these counter and mask operations are independent of the port's chip enable inputs (CE0 and CE1).

Counter enable (CNTEN) inputs are provided to stall the operation of the address input and utilize the internal address generated by the internal counter for fast, interleaved memory applications. A port's burst counter is loaded when the port's address strobe (ADS) and CNTEN signals are LOW. When the port's CNTEN is asserted and the ADS is deasserted, the address counter will increment on each LOW to HIGH transition of that port's clock signal. This will Read/Write one word from/into each successive address location until CNTEN is deasserted. The counter can address the entire memory array, and will loop back to the start. Counter reset (CNTRST) is used to reset the unmasked portion of the burst counter to 0s. A counter-mask register is used to control the counter wrap.

Counter Reset Operation

All unmasked bits of the counter and mirror registers are reset to "0." All masked bits remain unchanged. A Mask Reset followed by a Counter Reset will reset the counter and mirror registers to 00000, as will master reset (MRST).

Counter Load Operation

The address counter and mirror registers are both loaded with the address value presented at the address lines.

Notes

25. X" = "Don't Care," "H" = HIGH, "L" = LOW.

26. Counter operation and mask register operation is independent of chip enables.

27. The CYD09S72V has 17 address bits and a maximum address value of 1FFFF. The CYD18S72V has 18 address bits and a maximum address value of 3FFFF.

Counter Increment Operation

Once the address counter register is initially loaded with an external address, the counter can internally increment the address value, potentially addressing the entire memory array. Only the unmasked bits of the counter register are incremented. The corresponding bit in the mask register must be a "1" for a counter bit to change. The counter register is incremented by 1 if the least significant bit is unmasked, and by 2 if it is masked. If all unmasked bits are "1," the next increment will wrap the counter back to the initially loaded value. If an Increment results in all the unmasked bits of the counter being "1s," a counter interrupt flag (CNTINT) is asserted. The next Increment will return the counter register to its initial value, which was stored in the mirror register. The counter address can instead be forced to loop to 0000 by externally connecting CNTINT to CNTRST.^[28] An increment that results in one or more of the unmasked bits of the counter being "0" will de-assert the counter interrupt flag. The example in [Figure 2](#) shows the counter mask register loaded with a mask value of 0003Fh unmasking the first 6 bits with bit "0" as the LSB and bit "16" as the MSB. The maximum value the mask register can be loaded with is 1FFFFh. Setting the mask register to this value allows the counter to access the entire memory space. The address counter is then loaded with an initial value of 8h. The base address bits (in this case, the 6th address through the 16th address) are loaded with an address value but do not increment once the counter is configured for increment operation. The counter address will start at address 8h. The counter will increment its internal address value till it reaches the mask register value of 3Fh. The counter wraps around the memory block to location 8h at the next count. CNTINT is issued when the counter reaches its maximum value.

Counter Hold Operation

The value of all three registers can be constantly maintained unchanged for an unlimited number of clock cycles. Such operation is useful in applications where wait states are needed, or when address is available a few cycles ahead of data in a shared bus interface.

Counter Interrupt

The counter interrupt (CNTINT) is asserted LOW when an increment operation results in the unmasked portion of the counter register being all "1s." It is deasserted HIGH when an Increment operation results in any other value. It is also de-asserted by Counter Reset, Counter Load, Mask Reset and Mask Load operations, and by MRST.

Counter Readback Operation

The internal value of the counter register can be read out on the address lines. Readback is pipelined; the address will be valid t_{CA2} after the next rising edge of the port's clock. If address readback occurs while the port is enabled (CE0 LOW and CE1 HIGH), the data lines (DQs) will be three-stated. [Figure 1](#) shows a block diagram of the operation.

Retransmit

Retransmit is a feature that allows the Read of a block of memory more than once without the need to reload the initial address.

Note

28. CNTINT and CNTRST specs are guaranteed by design to operate properly at speed grade operating frequency when tied together.

This eliminates the need for external logic to store and route data. It also reduces the complexity of the system design and saves board space. An internal "mirror register" is used to store the initially loaded address counter value. When the counter unmasked portion reaches its maximum value set by the mask register, it wraps back to the initial value stored in this "mirror register." If the counter is continuously configured in increment mode, it increments again to its maximum value and wraps back to the value initially stored into the "mirror register." Thus, the repeated access of the same data is allowed without the need for any external logic.

Mask Reset Operation

The mask register is reset to all "1s," which unmasks every bit of the counter. Master reset (MRST) also resets the mask register to all "1s."

Mask Load Operation

The mask register is loaded with the address value presented at the address lines. Not all values permit correct increment operations. Permitted values are of the form 2^n-1 or 2^n-2 . From the most significant bit to the least significant bit, permitted values have zero or more "0s," one or more "1s," or one "0." Thus 1FFFF, 003FE, and 00001 are permitted values, but 1F0FF, 003FC, and 00000 are not.

Mask Readback Operation

The internal value of the mask register can be read out on the address lines. Readback is pipelined; the address will be valid t_{CM2} after the next rising edge of the port's clock. If mask readback occurs while the port is enabled (CE0 LOW and CE1 HIGH), the data lines (DQs) will be three-stated. [Figure 1](#) shows a block diagram of the operation.

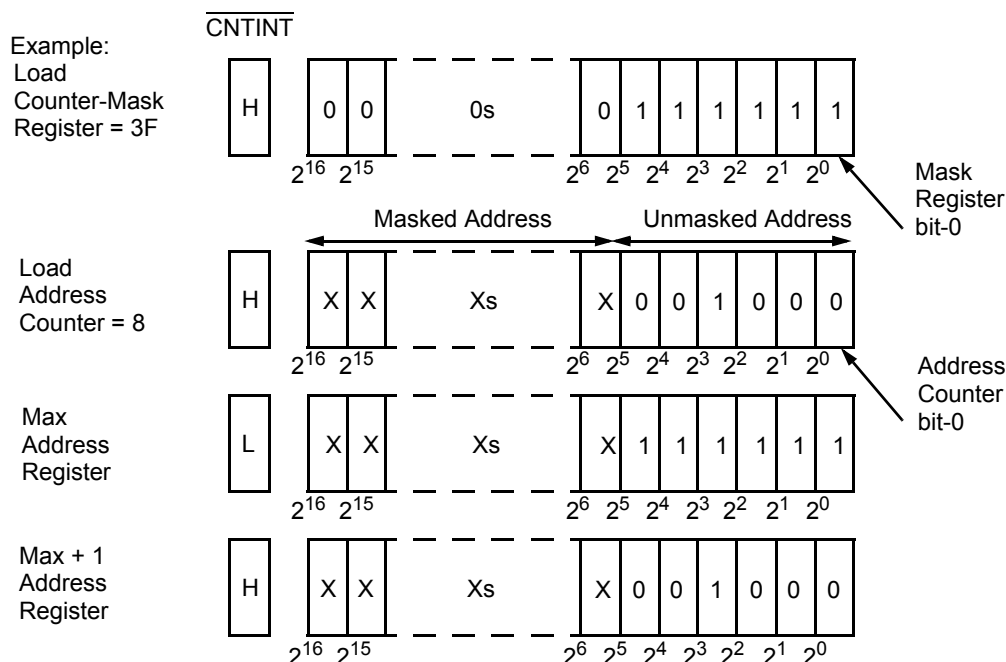

Counting by Two

When the least significant bit of the mask register is "0," the counter increments by two. This may be used to connect the x72 devices as a 144-bit single port SRAM in which the counter of one port counts even addresses and the counter of the other port counts odd addresses. This even-odd address scheme stores one half of the 144-bit data in even memory locations, and the other half in odd memory locations.

Figure 1. Counter, Mask, and Mirror Logic Block Diagram^[29]

Note
29. CYD09S72V have 17 address bits and CYD18S72V have 18 bits.

Figure 2. Programmable Counter-Mask Register Operation^[30, 31]

IEEE 1149.1 Serial Boundary Scan (JTAG)^[32]

The FLEx72 incorporates an IEEE 1149.1 serial boundary scan test access port (TAP). The TAP controller functions in a manner that does not conflict with the operation of other devices using 1149.1-compliant TAPs. The TAP operates using JEDEC-standard 3.3 V I/O logic levels. It is composed of three input connections and one output connection required by the test logic defined by the standard.

Performing a TAP Reset

A reset is performed by forcing TMS HIGH (V_{DD}) for five rising edges of TCK. This reset does not affect the operation of the FLEx72 family and may be performed while the device is operating. An MRST must be performed on the FLEx72 after power-up.

Performing a Pause/Restart

When a SHIFT-DR PAUSE-DR SHIFT-DR is performed the scan chain will output the next bit in the chain twice. For example, if the value expected from the chain is 1010101, the device will output a 11010101. This extra bit will cause some testers to report an erroneous failure for the FLEx72 in a scan test. Therefore the tester should be configured to never enter the PAUSE-DR state.

Boundary Scan Hierarchy for FLEx72 Family

Internally, the CYD09S72V has two DIEs while CYD18S72V has four DIEs. Each DIE contains all the circuitry required to support

Notes

30. CYD09S72V have 17 address bits and CYD18S72V have 18 bits.

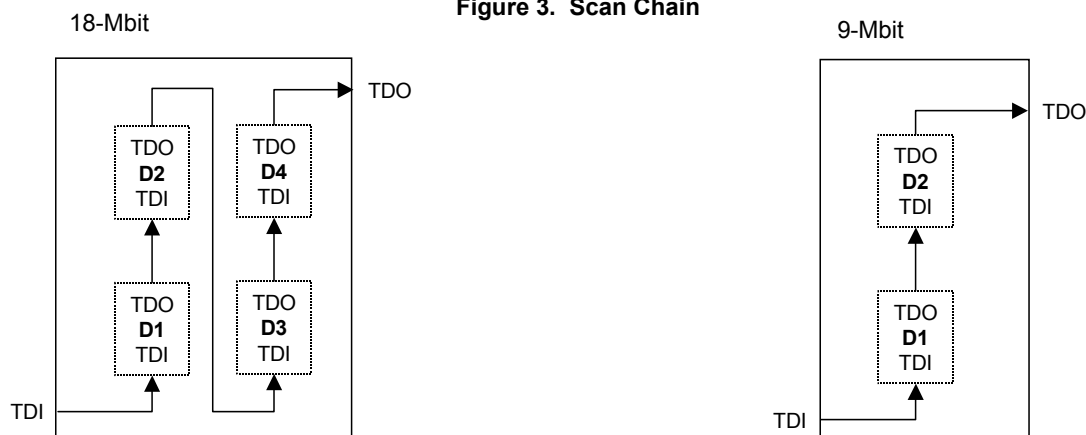

31. The "X" in this diagram represents the counter upper bits.

32. Boundary scan is IEEE 1149.1-compatible. See "Performing a Pause/Restart" for deviation from strict 1149.1 compliance.

boundary scan testing. The circuitry includes the TAP, TAP controller, instruction register, and data registers. The circuitry and operation of the DIE boundary scan are described in detail below. The scan chain of each DIE is connected serially to form the scan chain of the FLEx72 family as shown in Figure 3. TMS and TCK are connected in parallel to each DIE to drive all 4 TAP controllers in unison. In many cases, each DIE will be supplied with the same instruction. In other cases, it might be useful to supply different instructions to each DIE. One example would be testing the device ID of one DIE while bypassing the others.

Each pin of FLEx72 family is typically connected to multiple DIEs. For connectivity testing with the EXTEST instruction, it is desirable to check the internal connections between DIEs as well as the external connections to the package. This can be accomplished by merging the netlist of the devices with the netlist of the user's circuit board. To facilitate boundary scan testing of the devices, Cypress provides the BSDL file for each DIE, the internal netlist of the device, and a description of the device scan chain. The user can use these materials to easily integrate the devices into the board's boundary scan environment.

Figure 3. Scan Chain

Identification Register Definitions

Instruction Field	Value	Description
Revision number(31:28)	0h	Reserved for version number
Cypress device(27:12)	C002h	Defines Cypress DIE number for CYD18S72V and CYD09S72V
Cypress JDEC ID(11:1)	034h	Allows unique identification of FLEx72 family device vendor
ID register presence (0)	1	Indicates the presence of an ID register

Scan Registers Sizes

Register Name	Bit Size
Instruction	4
Bypass	1
Identification	32
Boundary scan	n ^[33]

Instruction Identification Codes

Instruction	Code	Description
EXTEST	0000	Captures the Input/Output ring contents. Places the BSR between the TDI and TDO
BYPASS	1111	Places the BYR between TDI and TDO
IDCODE	1011	Loads the IDR with the vendor ID code and places the register between TDI and TDO
HIGHZ	0111	Places BYR between TDI and TDO. Forces all FLEx72 output drivers to a High-Z state
CLAMP	0100	Controls boundary to 1/0. Places BYR between TDI and TDO
SAMPLE/PRELOAD	1000	Captures the input/output ring contents. Places BSR between TDI and TDO
NBSRST	1100	Resets the non-boundary scan logic. Places BYR between TDI and TDO
RESERVED	All other codes	Other combinations are reserved. Do not use other than the above

Note

33. See details in the device BSDL files.

Maximum Ratings^[34]

(Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested)

Storage temperature -65 °C to + 150 °C

Ambient temperature with power applied -55 °C to + 125 °C

Supply voltage to ground potential -0.5 V to + 4.6 V

DC Voltage Applied to

Outputs in High-Z state -0.5 V to $V_{DD} + 0.5$ V

DC input voltage -0.5 V to $V_{DD} + 0.5$ V^[36]

Output current into outputs (LOW) 20 mA

Static discharge voltage > 2000 V

(JEDEC JESD22-A114-2000B)

Latch-up current > 200 mA

Operating Range

Range	Ambient Temperature	V_{DD}	V_{CORE} ^[35]
Commercial	0 °C to +70 °C	3.3 V ± 165 mV	1.8 V ± 100 mV
Industrial	-40 °C to +85 °C	3.3 V ± 165 mV	1.8 V ± 100 mV

I_{CORE} ^[35]	Core operating current for ($V_{DD} = \text{Max.}$, $I_{OUT} = 0$ mA), outputs disabled		—	0	0	—	0	0	mA

Notes

34. The voltage on any input or I/O pin can not exceed the power pin during power-up.

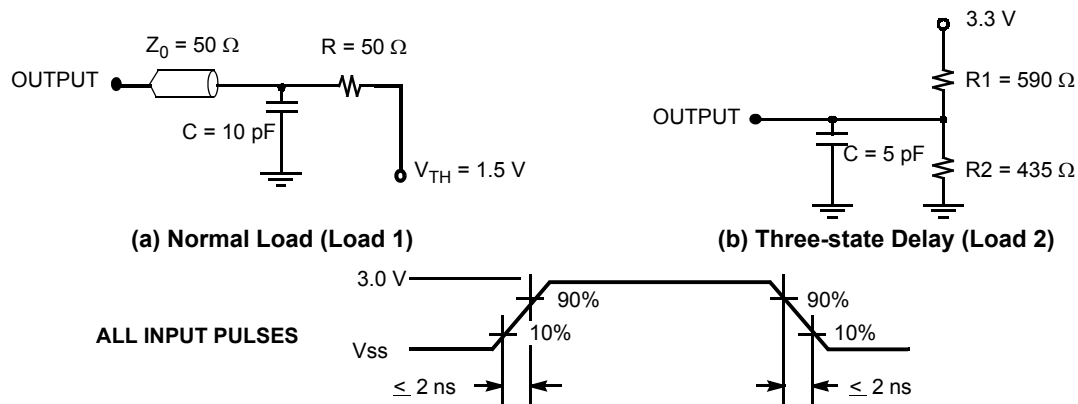

35. This family of Dual-Ports does not use V_{CORE} , and these pins are internally NC. The next generation Dual-Port family, the FLE72-E™, will use V_{CORE} of 1.5 V or 1.8 V. Please contact local Cypress FAE for more information.

36. Pulse width < 20 ns.

Switching Waveforms

Switching Waveforms (continued)

Figure 6. Bank Select Read^[47, 48]

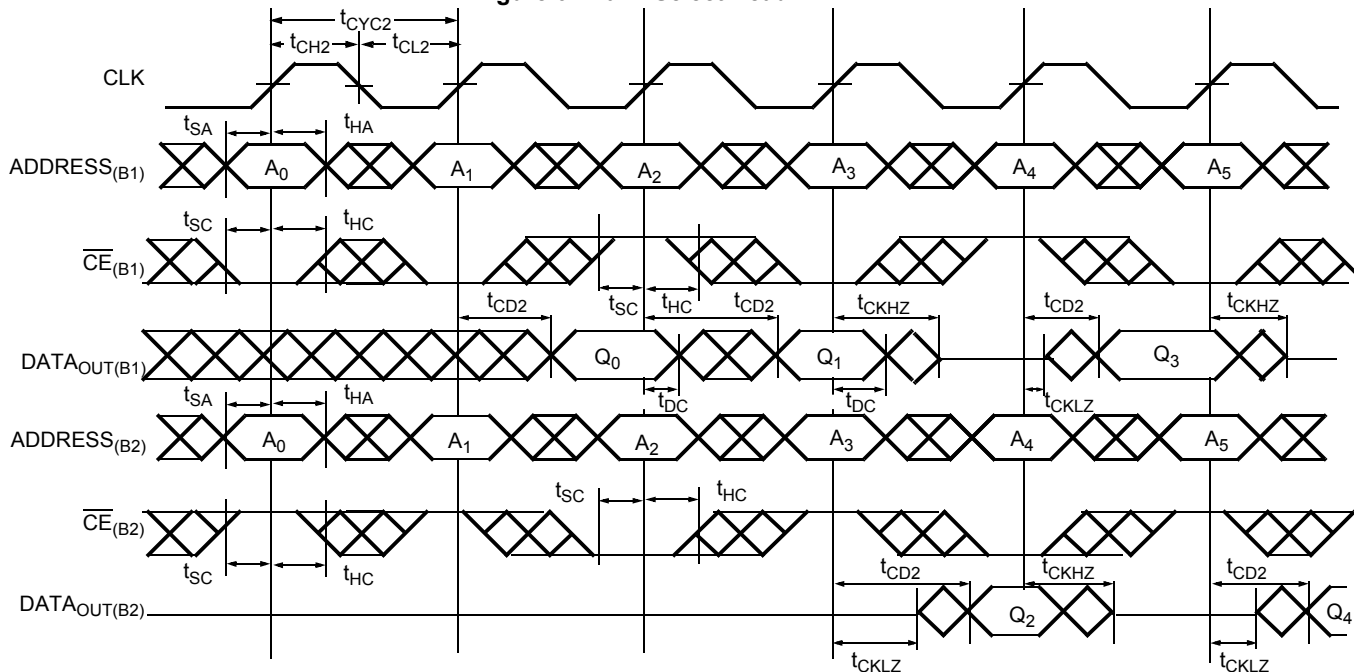

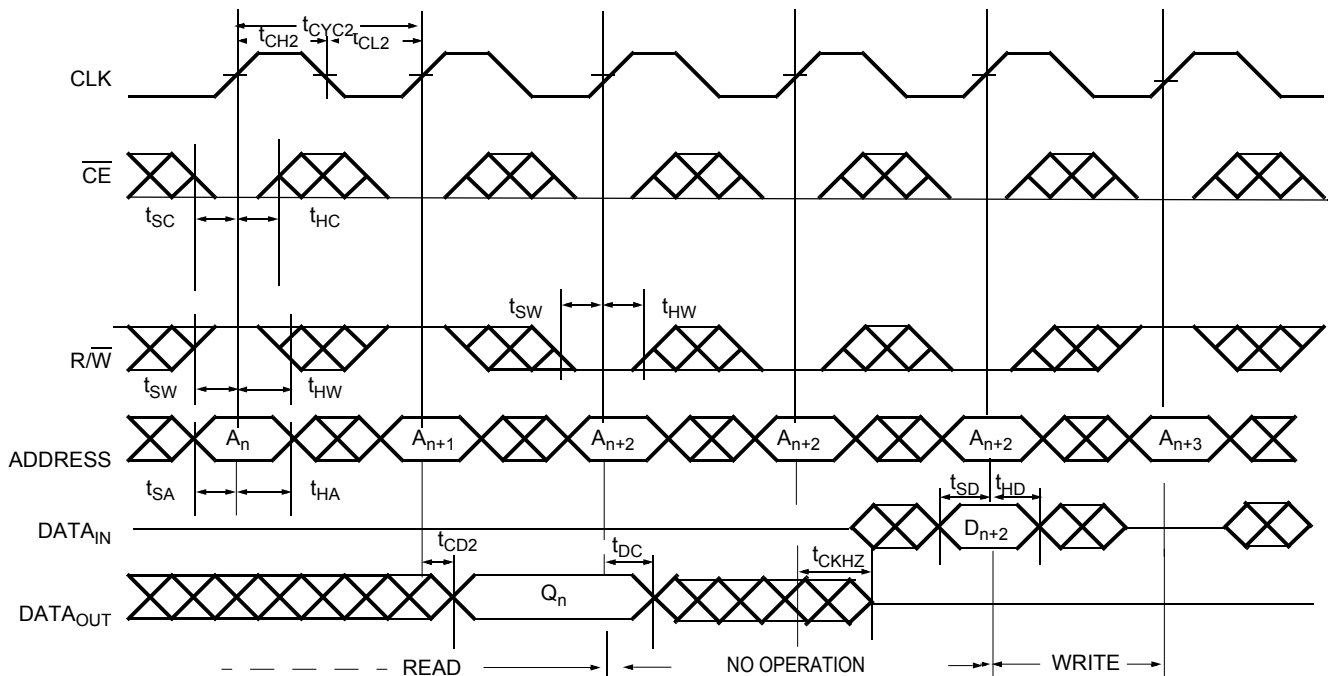

Figure 7. Read-to-Write-to-Read ($\overline{OE} = \text{LOW}$)^[46, 49, 50, 51, 52]

Notes

47. In this depth-expansion example, B1 represents Bank #1 and B2 is Bank #2; each bank consists of one Cypress FLE72 device from this data sheet. ADDRESS_(B1) = ADDRESS_(B2).
48. $\overline{ADS} = \overline{CNTEN} = \overline{BE0} - \overline{BE7} = \overline{OE} = \text{LOW}$; $\overline{MRST} = \overline{CNTRST} = \overline{CNT/MSK} = \text{HIGH}$.
49. Output state (HIGH, LOW, or high-impedance) is determined by the previous cycle control signals.
50. During "No Operation," data in memory at the selected address may be corrupted and should be rewritten to ensure data integrity.
51. $\overline{CE_0} = \overline{OE} = \overline{BE0} - \overline{BE7} = \text{LOW}$; $\overline{CE_1} = \overline{R/W} = \overline{CNTRST} = \overline{MRST} = \text{HIGH}$.
52. $\overline{CE_0} = \overline{BE0} - \overline{BE7} = \overline{R/W} = \text{LOW}$; $\overline{CE_1} = \overline{CNTRST} = \overline{MRST} = \overline{CNT/MSK} = \text{HIGH}$. When R/W first switches low, since OE = LOW, the Write operation cannot be completed (labelled as no operation). One clock cycle is required to three-state the I/O for the Write operation on the next rising edge of CLK.

Switching Waveforms (continued)

Figure 8. Read-to-Write-to-Read ($\overline{\text{OE}}$ Controlled)^[53, 54, 55, 56]

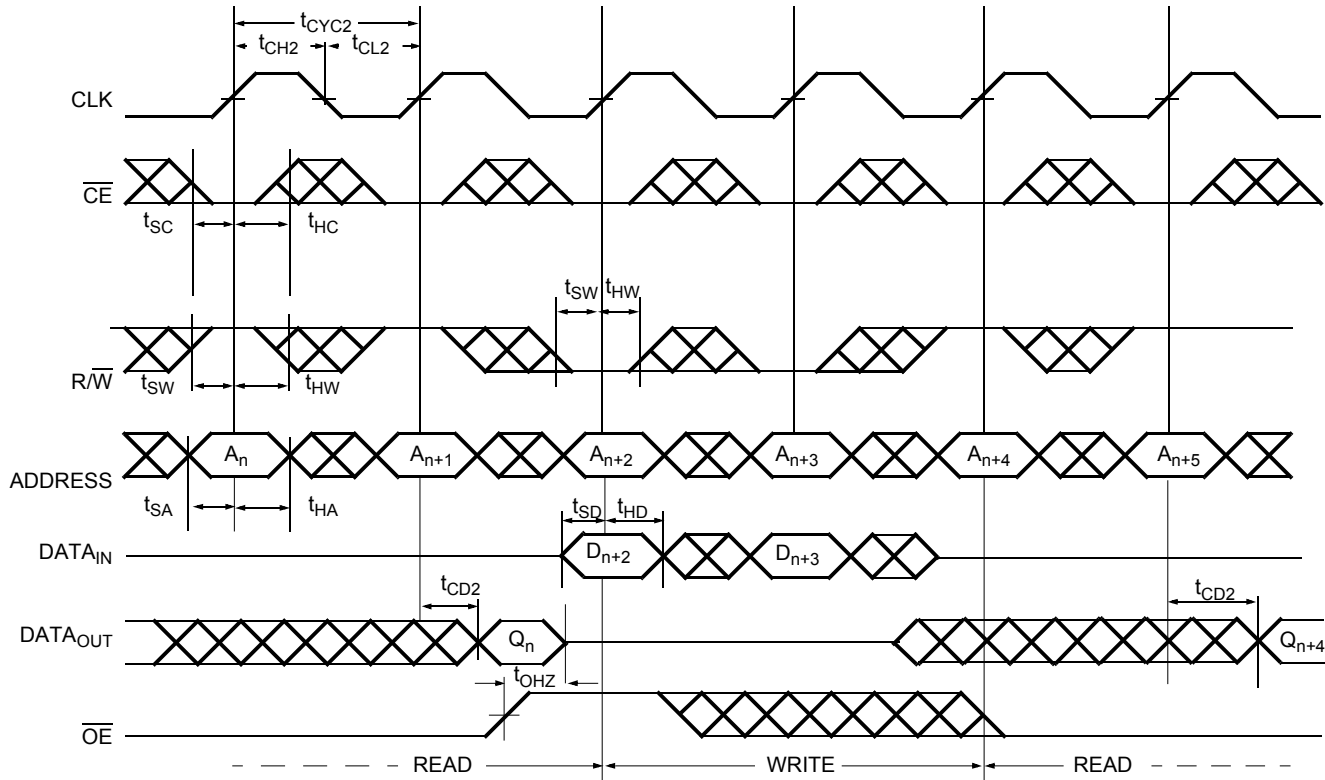

Figure 9. Read with Address Counter Advance^[55]

Notes

53. Addresses do not have to be accessed sequentially since $\overline{\text{ADS}} = \overline{\text{CNTEN}} = V_{IL}$ with $\text{CNT}/\overline{\text{MSK}} = V_{IH}$ constantly loads the address on the rising edge of the CLK. Numbers are for reference only.

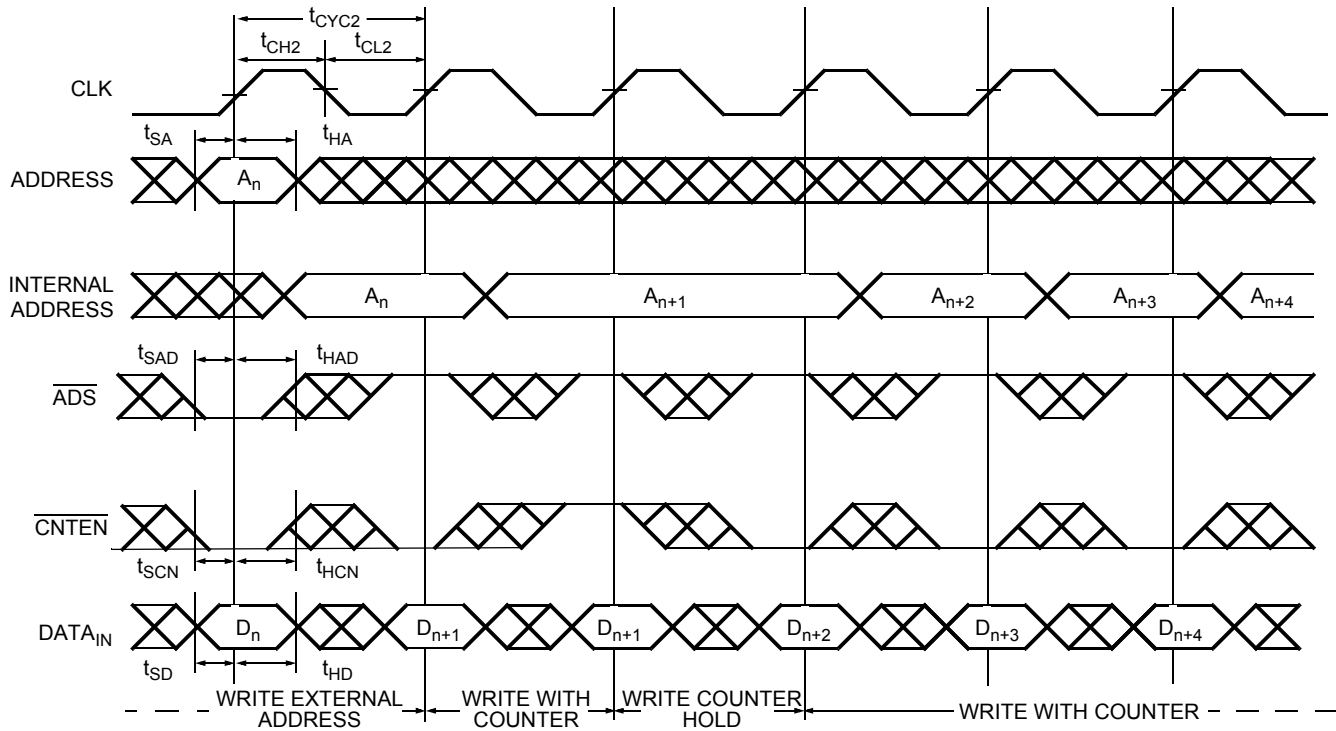

54. Output state (HIGH, LOW, or high-impedance) is determined by the previous cycle control signals.

55. $\overline{\text{CE}}_0 = \overline{\text{OE}} = \overline{\text{BE}}_0 - \overline{\text{BE}}_7 = \text{LOW}$; $\overline{\text{CE}}_1 = \text{R}/\overline{\text{W}} = \overline{\text{CNRST}} = \overline{\text{MRST}} = \text{HIGH}$

56. $\overline{\text{CE}}_0 = \overline{\text{BE}}_0 - \overline{\text{BE}}_7 = \text{R}/\overline{\text{W}} = \text{LOW}$; $\overline{\text{CE}}_1 = \overline{\text{CNRST}} = \overline{\text{MRST}} = \text{CNT}/\overline{\text{MSK}} = \text{HIGH}$. When $\text{R}/\overline{\text{W}}$ first switches low, since $\overline{\text{OE}} = \text{LOW}$, the Write operation cannot be completed (labelled as no operation). One clock cycle is required to three-state the I/O for the Write operation on the next rising edge of CLK.

Switching Waveforms (continued)

Figure 10. Write with Address Counter Advance^[57]

Note

57. $\overline{CE}_0 = \overline{BE}_0 - \overline{BE}_7 = R/\overline{W} = \text{LOW}$; $\overline{CE}_1 = \overline{CNT}/\overline{RST} = \overline{MRST} = \overline{CNT}/\overline{MSK} = \text{HIGH}$. When R/\overline{W} first switches low, since $OE = \text{LOW}$, the Write operation cannot be completed (labelled as no operation). One clock cycle is required to three-state the I/O for the Write operation on the next rising edge of CLK.

Switching Waveforms (continued)

Figure 11. Counter Reset ^[58, 59]

Notes

58. $\overline{CE_0} = \overline{BE_0} - \overline{BE_7} = \text{LOW}$; $\overline{CE_1} = \overline{MRST} = \text{CNT}/\overline{MSK} = \text{HIGH}$.

59. No dead cycle exists during counter reset. A Read or Write cycle may be coincidental with the counter reset.

Switching Waveforms (continued)

Figure 12. Readback State of Address Counter or Mask Register^[60, 61, 62, 63]

Notes

60. $\overline{CE_0} = \overline{OE} = \overline{BE_0} - \overline{BE_7} = \text{LOW}$; $CE_1 = R/\overline{W} = \overline{CNRST} = \overline{MRST} = \text{HIGH}$.

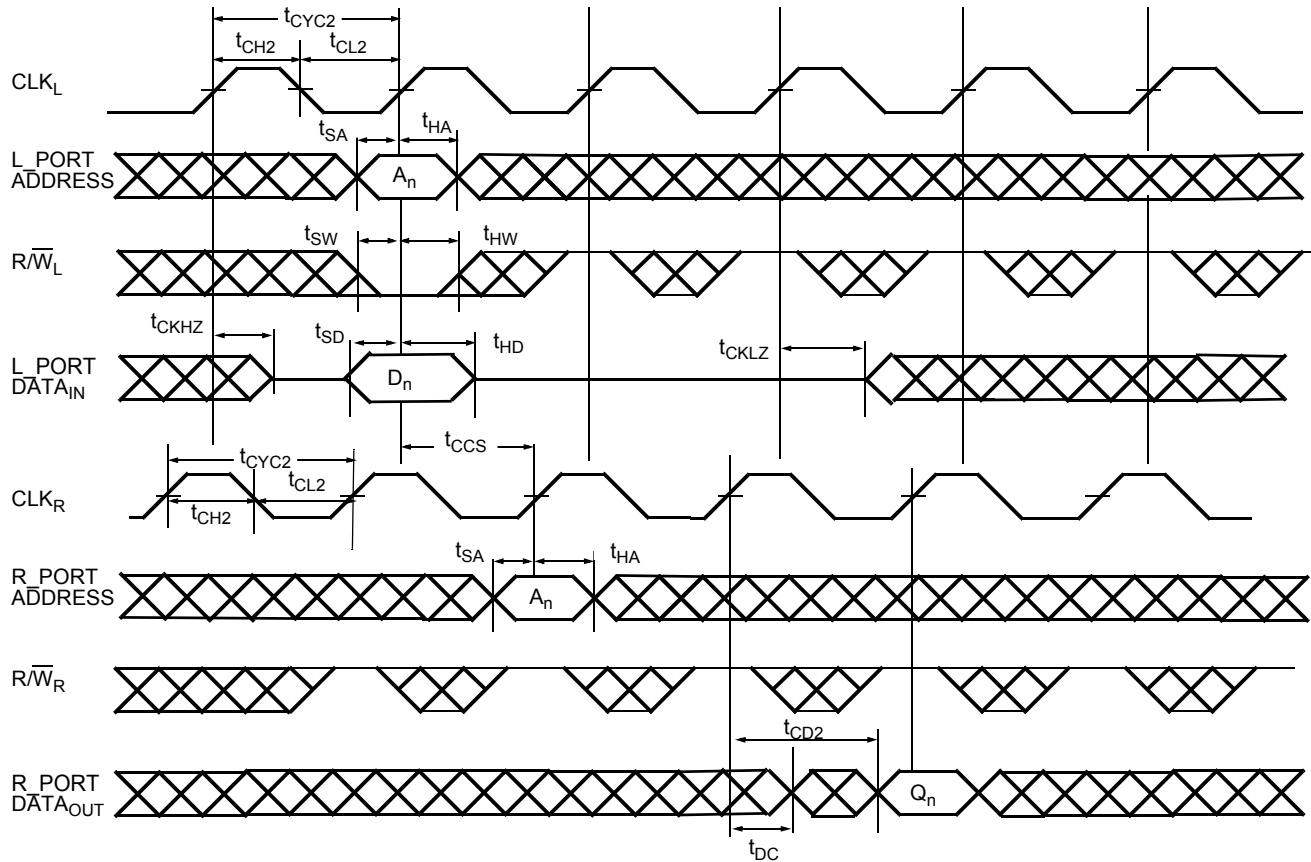

61. Address in output mode. Host must not be driving address bus after t_{CKLZ} in next clock cycle.

62. Address in input mode. Host can drive address bus after t_{CKHZ} .

63. A_n^* is the internal value of the address counter (or the mask register depending on the CNT/MSK level) being Read out on the address lines.

Switching Waveforms (continued)

Figure 13. Left_Port (L_Port) Write to Right_Port (R_Port) Read^[64, 65, 66]

Notes

64. $\overline{CE_0} = \overline{OE} = \overline{ADS} = \overline{CNTEN} = \overline{BE_0} - \overline{BE_7} = \text{LOW}$; $CE_1 = \overline{CNTRST} = \overline{MRST} = \overline{CNT/MSK} = \text{HIGH}$.

65. This timing is valid when one port is writing, and other port is reading the same location at the same time. If t_{CCS} is violated, indeterminate data will be Read out.

66. If $t_{CCS} < \text{minimum specified value}$, then R_Port will Read the most recent data (written by L_Port) only ($2 * t_{CYC2} + t_{CD2}$) after the rising edge of R_Port's clock. If $t_{CCS} \geq \text{minimum specified value}$, then R_Port will Read the most recent data (written by L_Port) ($t_{CYC2} + t_{CD2}$) after the rising edge of R_Port's clock.

Switching Waveforms (continued)

Figure 14. Counter Interrupt and Retransmit^[67, 68, 69, 70, 71]

Figure 15. Mailbox Interrupt Timing^[72, 73, 74, 75, 76]

Notes

67. $\overline{CE_0} = \overline{OE} = \overline{BE_0} - \overline{BE_7} = \text{LOW}$; $CE_1 = R/\overline{W} = \overline{CNTRST} = \overline{MRST} = \text{HIGH}$.
68. \overline{CNTINT} is always driven.
69. \overline{CNTINT} goes LOW when the unmasked portion of the address counter is incremented to the maximum value.
70. The mask register assumed to have the value of 1FFFFh.
71. Retransmit happens if the counter remains in increment mode after it wraps to initially loaded value.
72. $\overline{CE_0} = \overline{OE} = \overline{ADS} = \overline{CNTEN} = \text{LOW}$; $CE_1 = \overline{CNTRST} = \overline{MRST} = \overline{CNT/MSK} = \text{HIGH}$.
73. Address "1FFFF" is the mailbox location for R_Port.
74. L_Port is configured for Write operation, and R_Port is configured for Read operation.
75. At least one byte enable ($\overline{B0} - \overline{B3}$) is required to be active during interrupt operations.
76. Interrupt flag is set with respect to the rising edge of the Write clock, and is reset with respect to the rising edge of the Read clock.

Table 3. Read/Write and Enable Operation (Any Port) [77, 78, 79, 80, 81]

Inputs					Outputs	Operation
$\overline{\text{OE}}$	CLK	$\overline{\text{CE}}_0$	CE_1	$\overline{\text{R/W}}$	$\text{DQ}_0 - \text{DQ}_{71}$	
X		H	X	X	High-Z	Deselected
X		X	L	X	High-Z	Deselected
X		L	H	L	D_{IN}	Write
L		L	H	H	D_{OUT}	Read
H	X	L	H	X	High-Z	Outputs disabled

Notes

77. CYD09S72V have 17 address bits and CYD18S72V have 18 bits.

78. X" = "Don't Care," "H" = HIGH, "L" = LOW.

 79. $\overline{\text{OE}}$ is an asynchronous input signal.

 80. When $\overline{\text{CE}}$ changes state, deselection and Read happen after one cycle of latency.

 81. $\overline{\text{CE}}_0 = \overline{\text{OE}} = \text{LOW}$; $\text{CE}_1 = \overline{\text{R/W}} = \text{HIGH}$.

*E	288892	See ECN	WWZ	Change pinout D15 from REV[2,4] to VSS to reflect SC pin removal
*F	327355	See ECN	AEQ	Changed pinout K3 from NC to NC[2,5] Changed pinout K20 from NC to NC[2,5] Changed pinout D15 from VSS to NC Changed pinout D8 and M3 from REVL[2,4] to VSS Changed pinout M20 and W15 from REVR[2,4] to VSS
*G	345735	See ECN	PCX	VREF Pin Definition Updated Added Pb-Free Part Ordering Informations
*H	360316	See ECN	YDT	Added note for V _{CORE} Changed notes for PORTSTD to VSS Changed ICC, ISB1, ISB2 and ISB4 number for CYD09S72V per PE request
*I	460454	See ECN	YDT	Changed CYDxxS72AV to CYDxxS72V (rev. A not implemented)
*J	2898491	07/01/10	AJU	Removed inactive parts from Ordering Information. Updated Packaging Information
*K	3110296	12/14/2010	ADMU	Updated Ordering Information . Added Ordering Code Definitions .
*L	3265044	05/25/2011	ADMU	Updates link to Application note. Removed obsolete part information. Notes updated across datasheet as per template. Added Acronyms and Units of measure table.
*M	3402091	10/12/2011	ADMU	Removed pruned part CYD18S72V-133BBC from Ordering Information Updated Package Diagram
*N	3859909	01/07/2013	ADMU	Updated Ordering Information (Updated part numbers). Updated Package Diagram : spec 51-85124 – Changed revision from *H to *I.

Document History Page (continued)

Document Title: CYD09S72V/CYD18S72V, FLEx72™ 3.3 V 128 K/256 K × 72 Synchronous Dual-Port RAM Document Number: 38-06069				
Rev.	ECN No.	Issue Date	Orig. of Change	Description of Change
*O	4402775	06/10/2014	ADMU	Removed CYD04S72V related information in all instances across the document. Removed 167 MHz frequency related information in all instances across the document. Updated in new template.
*P	4581625	11/27/2014	ADMU	Added related documentation hyperlink in page 1.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
