

The 6N137, HCPL-26xx, HCPL-06xx, HCPL-4661, HCNW137, and HCNW26x1 are suitable for high speed logic interfacing, input/output buffering, as line receivers in environments that conventional line receivers cannot tolerate and are recommended for use in extremely high ground or induced noise environments.

Functional Diagram

NOTE: A 0.1-μF bypass capacitor must be connected as close as possible between pins 5 and 8.

Selection Guide

Minimum CMR		Input On-Current (mA)	Output Enable	8-Pin DIP (300 Mil)		Small-Outline SO-8		Widebody (400 Mil)	Hermetic

1000	50	12.5	^c						HCPL-193x ^a HCPL-56xx ^a HCPL-66xx ^a

a. Technical data are on separate Broadcom publications.

b. 15 kV/μs with V_{CM} = 1 kV can be achieved using Broadcom application circuit.3.

c. Enable is available for single channel products only, except for HCPL-193x devices.

Ordering Information

HCPL-xxxx is UL Recognized with 3750 V_{rms} for 1 minute per UL1577.

HCNWxxxx is UL Recognized with 5000 V_{rms} for 1 minute per UL1577.

Table 1: Ordering Information

To order, choose a part number from the part number column and combine with the desired option from the option column to form an order entry. Combinations of Option 020 and Option 060 are not available.

Example 1:

HCPL-2611-560E to order product of 300-mil DIP Gull Wing Surface Mount package in Tape and Reel packaging with IEC/EN/DIN EN 60747-5-5 Safety Approval in RoHS compliant.

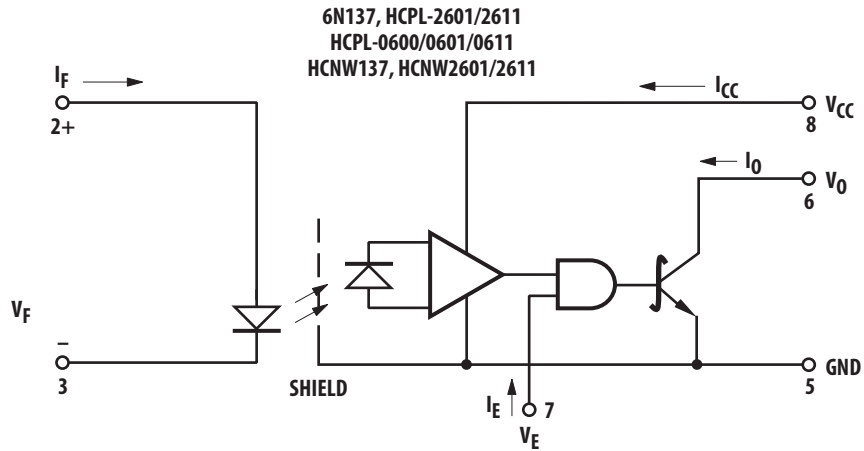

Example 2:

HCPL-2630 to order product of 300-mil DIP package in tube packaging and non RoHS compliant.

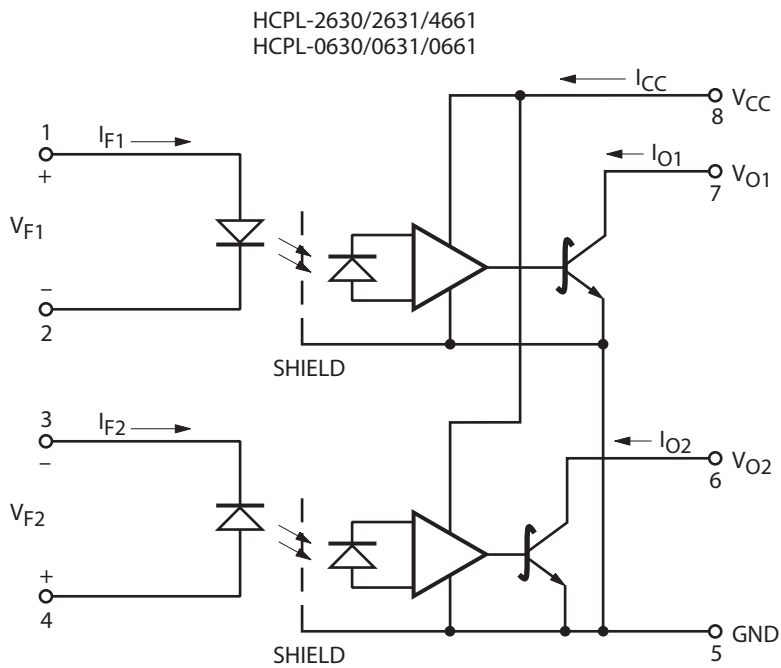

Option data sheets are available. Contact your Broadcom sales representative or authorized distributor for information.

NOTE: The notation “#xxx” is used for existing products, while products launched since July 15, 2001 and RoHS compliant option use “-xxxE”.

Schematic

USE OF A 0.1 μ F BYPASS CAPACITOR CONNECTED AS CLOSE AS POSSIBLE BETWEEN PINS 5 AND 8 IS RECOMMENDED.

Package Outline Drawings

8-pin DIP Package¹ (6N137, HCPL-2601/11/30/31, HCPL-4661)

1. JEDEC Registered Data (for 6N137 only).

8-pin DIP Package with Gull Wing Surface Mount Option 300 (6N137, HCPL-2601/ 11/30/31, HCPL-4661)

Small-Outline SO-8 Package (HCPL-0600/01/11/30/31/61)

8-Pin Widebody DIP Package (HCNW137, HCNW2601/11)

8-Pin Widebody DIP Package with Gull Wing Surface Mount Option 300 (HCNW137, HCNW2601/11)

Test Rating Code, Z	Optional Identification Code
L – Option x2x	A – Avago
V – Option x5x or x6x	 – UL Logo
	P – Special Program Code

Reflow Soldering Profile

The recommended reflow soldering conditions are per JEDEC Standard J-STD-020 (latest revision). Non-halide flux should be used.

Regulatory Information

The 6N137, HCPL-26xx/06xx/46xx, and HCNW137/26xx have been approved by the following organizations:

- UL

IEC/EN/DIN EN 60747-5-5

CSA
- Recognized under UL 1577, Component Recognition Program, File E55361.

Approved under CSA Component Acceptance Notice #5, File CA 88324.

Insulation and Safety-Related Specifications

Parameter	Symbol	8-pin DIP (300 Mil)	SO-8	Widebody (400 Mil)	Units	Conditions
Minimum External Air Gap (External Clearance)	L(101)	7.1	4.9	9.6	mm	Measured from input terminals to output terminals, shortest distance through air.
Minimum External Tracking (External Creepage)	L(102)	7.4	4.8	10.0	mm	Measured from input terminals to output terminals, shortest distance path along body.
Minimum Internal Plastic Gap (Internal Clearance)		0.08	0.08	1.0	mm	Through insulation distance, conductor to conductor, usually the direct distance between the photoemitter and photodetector inside the optocoupler cavity.
Minimum Internal Tracking (Internal Creepage)		NA	NA	4.0	mm	Measured from input terminals to output terminals, along internal cavity.
Tracking Resistance (Comparative Tracking Index)	CTI	200	200	200	V	DIN IEC 112/VDE 0303 Part 1
Isolation Group		IIIa	IIIa	IIIa		Material Group (DIN VDE 0110, 1/89, Table 1)

Option 300 – Surface mount classification is Class A in accordance with CECC 00802.

IEC/EN/DIN EN 60747-5-5 Insulation Characteristics² (HCPL-06xx Option 060 Only)

Description	Symbol	Characteristic	Units
Installation classification per DIN VDE 0110, Table 1 for rated mains voltage $\leq 150 V_{rms}$ for rated mains voltage $\leq 300 V_{rms}$ for rated mains voltage $\leq 600 V_{rms}$		I-IV I-IV I-III	
Climatic Classification		40/85/21	
Pollution Degree (DIN VDE 0110/39)		2	
Maximum Working Insulation Voltage	V_{IORM}	567	V_{peak}

Absolute Maximum Ratings⁵

No derating required up to 85°C.

Parameter	Symbol	Package ^a	Min.	Max.	Units	Note
Storage Temperature	T_S		-55	125	°C	
Operating Temperature ^b	T_A		-40	85	°C	
Average Forward Input Current	I_F	Single 8-Pin DIP Single SO-8 Widebody	—	20	mA	c
		Dual 8-Pin DIP Dual SO-8	—	15		d, e
Reverse Input Voltage	V_R	8-Pin DIP, SO-8	—	5	V	d
		Widebody	—	3		
Input Power Dissipation	P_I	Widebody	—	40	mW	
		Single 8-Pin DIP	—	36		
		Dual 8-Pin DIP	—	27		
Supply Voltage (1 Minute Maximum)	V_{CC}		—	7	V	
Enable Input Voltage (not to exceed V_{CC} by more than 500 mV)	V_E	Single 8-Pin DIP Single SO-8 Widebody	—	$V_{CC} + 0.5$	V	
Enable Input Current	I_E		—	5	mA	
Output Collector Current	I_O		—	50	mA	d
Output Collector Voltage	V_O		—	7	V	d
Output Collector Power Dissipation	P_O	Single 8-Pin DIP Single SO-8 Widebody	—	85	mW	
		Dual 8-Pin DIP Dual SO-8	—	60		
Lead Solder Temperature (Through Hole Parts Only)	T_{LS}	8-Pin DIP	—	260°C for 10 s, 1.6 mm below seating plane		
		Widebody	—	260°C for 10s, up to seating plane		
Solder Reflow Temperature Profile (Surface Mount Parts Only)		SO-8 and Option 300	—	See Package Outline Drawings		

- Ratings apply to all devices except otherwise noted in the Package column.
- 0°C to 70°C on JEDEC Registration.
- Peaking circuits may produce transient input currents up to 50 mA, 50 ns maximum pulse width, provided average current does not exceed 20 mA.
- Each channel.
- Peaking circuits may produce transient input currents up to 50 mA, 50 ns maximum pulse width, provided average current does not exceed 15 mA.
- Derate linearly above 80°C free-air temperature at a rate of 2.7 mW/°C for the SOIC-8 package.

5. JEDEC Registered Data (for 6N137 only).

Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Input Current, Low Level	I_{FL}^a	0	250	μA
Input Current, High Level ^b	I_{FH}^c	5	15	mA
Power Supply Voltage	V_{CC}	4.5	5.5	V
Low Level Enable Voltage ^d	V_{EL}	0	0.8	V
High Level Enable Voltage ^d	V_{EH}	2.0	V_{CC}	V
Operating Temperature	T_A	-40	85	$^{\circ}C$
Fan Out (at $R_L = 1\text{ k}\Omega$) ^b	N	—	5	TTL Loads
Output Pull-up Resistor	R_L	330	4 k	Ω

- a. The off condition can also be guaranteed by ensuring that $V_{FL} \leq 0.8V$.
- b. Each channel.
- c. The initial switching threshold is 5 mA or less. It is recommended that 6.3 mA to 10 mA be used for best performance and to permit at least a 20% LED degradation guardband.
- d. For single channel products only.

Electrical Specifications

Over recommended temperature ($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$) unless otherwise specified. All Typicals at $V_{CC} = 5\text{V}$, $T_A = 25^\circ\text{C}$.

All enable test conditions apply to single channel products only. See note.

Table 2: Electrical Specifications

Parameter	Sym.	Package	Min.	Typ.	Max.	Units	Test Conditions	Figure	Note

- JEDEC registered data for the 6N137. The JEDEC Registration specifies 0°C to +70°C. Broadcom specifies -40°C to +85°C.
- Each channel.
- The JEDEC registration for the 6N137 specifies a maximum I_{OH} of 250 μA . Broadcom guarantees a maximum I_{OH} of 100 μA .
- No external pull up is required for a high logic state on the enable input. If the V_E pin is not used, tying V_E to V_{CC} will result in improved CMR performance. For single channel products only.
- The JEDEC registration for the 6N137 specifies a maximum I_{CCH} of 15 mA. Broadcom guarantees a maximum I_{CCH} of 10 mA.
- The JEDEC registration for the 6N137 specifies a maximum I_{CCL} of 18 mA. Broadcom guarantees a maximum I_{CCL} of 13 mA.
- The JEDEC registration for the 6N137 specifies a maximum I_{EL} of -2.0 mA. Broadcom guarantees a maximum I_{EL} of -1.6 mA.

Switching Specifications (AC)

Over Recommended Temperature ($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$), $V_{CC} = 5\text{V}$, $I_F = 7.5\text{ mA}$ unless otherwise specified.

All Typicals at $T_A = 25^\circ\text{C}$, $V_{CC} = 5\text{V}$.

Parameter	Symbol	Package ^a	Min.	Typ.	Max.	Units	Test Conditions	Figure	Note

- Ratings apply to all devices except otherwise noted in the Package column.
- JEDEC registered data for the 6N137.
- Each channel.
- The t_{PLH} propagation delay is measured from the 3.75 mA point on the falling edge of the input pulse to the 1.5V point on the rising edge of the output pulse.
- The t_{PHL} propagation delay is measured from the 3.75 mA point on the rising edge of the input pulse to the 1.5V point on the falling edge of the output pulse.
- No external pull up is required for a high logic state on the enable input. If the V_E pin is not used, tying V_E to V_{CC} will result in improved CMR performance. For single channel products only.
- See [Propagation Delay, Pulse-Width Distortion, and Propagation Delay Skew](#) for more information.
- t_{PSK} is equal to the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between units at any given temperature and specified test conditions.
- The t_{ELH} enable propagation delay is measured from the 1.5V point on the falling edge of the enable input pulse to the 1.5V point on the rising edge of the output pulse.
- The t_{EHL} enable propagation delay is measured from the 1.5V point on the rising edge of the enable input pulse to the 1.5V point on the falling edge of the output pulse.

- Each channel.
- CM_H is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (that is, $V_O > 2.0V$).
- For sinusoidal voltages, $(|dV_{CM}| / dt)_{max} = \pi f_{CM} V_{CM}(p-p)$.
- No external pull up is required for a high logic state on the enable input. If the V_E pin is not used, tying V_E to V_{CC} will result in improved CMR performance. For single channel products only.
- CM_L is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (that is, $V_O < 0.8V$).

Package Characteristics

All Typicals at $T_A = 25^\circ\text{C}$.

- JEDEC registered data for the 6N137. The JEDEC Registration specifies 0°C to 70°C . Broadcom specifies -40°C to 85°C .
- Device considered a two-terminal device: pins 1, 2, 3, and 4 shorted together, and pins 5, 6, 7, and 8 shorted together.
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 4500\text{ V}_{\text{rms}}$ for one second (leakage detection current limit, $I_{I-O} \leq 5\text{ }\mu\text{A}$). This test is performed before the 100% production test for partial discharge (Method b) shown in the IEC/EN/DIN EN 60747-5-5 Insulation Characteristics Table, if applicable.
- The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to the IEC/EN/DIN EN 60747-5-5 Insulation Characteristics Table (if applicable), your equipment level safety specification or Broadcom Application Note 1074, *Optocoupler Input-Output Endurance Voltage*.
- In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 6000\text{ V}_{\text{rms}}$ for one second (leakage detection current limit, $I_{I-O} \leq 5\text{ }\mu\text{A}$). This test is performed before the 100% production test for partial discharge (Method b) shown in the IEC/EN/DIN EN 60747-5-5 Insulation Characteristics Table, if applicable.
- For 6N137, HCPL-2601/2611/2630/2631/4661 only.
- Each channel.
- Measured between the LED anode and cathode shorted together and pins 5 through 8 shorted together. For dual channel products only.
- Measured between pins 1 and 2 shorted together, and pins 3 and 4 shorted together. For dual channel products only.

Propagation Delay, Pulse-Width Distortion, and Propagation Delay Skew

Propagation delay is a figure of merit which describes how quickly a logic signal propagates through a system. The propagation delay from low to high (t_{PLH}) is the amount of time required for an input signal to propagate to the output, causing the output to change from low to high. Similarly, the propagation delay from high to low (t_{PHL}) is the amount of time required for the input signal to propagate to the output causing the output to change from high to low (see [Figure 8](#)).

Pulse-width distortion (PWD) results when t_{PLH} and t_{PHL} differ in value. PWD is defined as the difference between t_{PLH} and t_{PHL} and often determines the maximum data rate capability of a transmission system. PWD can be expressed in percent by dividing the PWD (in ns) by the minimum pulse width (in ns) being transmitted. Typically, PWD on the order of 20 to 30% of the minimum pulse width is tolerable; the exact figure depends on the particular application (RS232, RS422, T-I, etc.).

Propagation delay skew, t_{PSK} , is an important parameter to consider in parallel data applications where synchronization of signals on parallel data lines is a concern. If the parallel data is being sent through a group of optocouplers, differences in propagation delays will cause the data to arrive at the outputs of the optocouplers at different times. If this difference in propagation delays is large enough, it will determine the maximum rate at which parallel data can be sent through the optocouplers.

Propagation delay skew is defined as the difference between the minimum and maximum propagation delays, either t_{PLH} or t_{PHL} , for any given group of optocouplers which are operating under the same conditions (i.e., the same drive current, supply voltage, output load, and operating temperature). As illustrated in [Figure 18](#), if the inputs of a group of optocouplers are switched either ON or OFF at the same time, t_{PSK} is the difference between the shortest propagation delay, either t_{PLH} or t_{PHL} , and the longest propagation delay, either t_{PLH} or t_{PHL} .

As mentioned earlier, t_{PSK} can determine the maximum parallel data transmission rate. [Figure 19](#) is the timing diagram of a typical parallel data application with both the clock and the data lines being sent through optocouplers. The figure shows data and clock signals at the inputs and

outputs of the optocouplers. To obtain the maximum data transmission rate, both edges of the clock signal are being used to clock the data; if only one edge were used, the clock signal would need to be twice as fast.

Propagation delay skew represents the uncertainty of where an edge might be after being sent through an optocoupler. [Figure 19](#) shows that there will be uncertainty in both the data and the clock lines. It is important that these two areas of uncertainty not overlap, otherwise the clock signal might arrive before all of the data outputs have settled, or some of the data outputs may start to change before the clock signal has arrived. From these considerations, the absolute minimum pulse width that can be sent through optocouplers in a parallel application is twice t_{PSK} . A cautious design should use a slightly longer pulse width to ensure that any additional uncertainty in the rest of the circuit does not cause a problem.

The t_{PSK} specified optocouplers offer the advantages of guaranteed specifications for propagation delays, pulsewidth distortion and propagation delay skew over the recommended temperature, input current, and power supply ranges.
