<sup>1.</sup> Short-circuits from the output to  $V_{CC}^+$  can cause excessive heating and eventual destruction. The maximum output current is approximately 20 mA, independent of the magnitude of  $V_{CC}^+$ .

Table 2. Operating conditions

| Symbol            | Parameter   | Value  | Unit |
|-------------------|---|--|------|
| V <sub>CC</sub>   | Supply voltage  | 2 to 32<br>±1 to ±16   | V    |
| V <sub>icm</sub>  | Common mode input voltage range $T_{min} \le T_{amb} \le T_{max}$ | 0 to (V <sub>CC</sub> <sup>+</sup> -1.5)<br>0 to (V <sub>CC</sub> <sup>+</sup> -2) | V    |
| T <sub>oper</sub> | Operating free-air temperature range                              | -40 to +125  | °C   |

Short-circuits can cause excessive heating. Destructive dissipation can result from simultaneous short-circuits on all amplifiers. All values are typical.

Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.

<sup>4.</sup> Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5  $\Omega$ ). This is done for all couples of connected pin combinations while the other pins are floating.

Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

<sup>1.</sup> At output switch point,  $V_O \approx 1.4 \text{ V}$ ,  $R_S = 0$  with  $V_{CC}^+$  from 5 V to 30 V, and over the full input common-mode range (0 V to  $V_{CC}^+$  –1.5 V).

5. Maximum values are guaranteed by design.

577

The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output, so there is no loading charge on the reference of input lines.

<sup>3.</sup> The response time specified is for a 100 mV input step with 5 mV overdrive.

<sup>4.</sup> Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range, the comparator will provide a proper output state. The low input voltage state must not be less than -0.3 V (or 0.3 V below the negative power supply, if used).
