

Absolute Maximum Ratings

(Voltages referenced to GND.)

V+, IN+, IN-.....	-0.3V to +16V	Operating Temperature Range.....	-40°C to +125°C
N_OUT, P_OUT.....	-0.3V to (V+ + 0.3V)	Junction Temperature.....	+150°C
N_OUT Continuous Output Current (Note 1).....	-200mA	Storage Temperature Range.....	-65°C to +150°C
P_OUT Continuous Output Current (Note 1).....	+125mA	Lead Temperature (soldering, 10s).....	+300°C
Continuous Power Dissipation (T _A = +70°C)		Soldering Temperature (reflow).....	+260°C
SOT23 (derate 8.7mW/°C above +70°C).....	696mW*		

*As per JEDEC 51 standard.

Note 1: Continuous output current is limited by the power dissipation of the package.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

6 SOT23

Package Code	U6+1A
Outline Number	21-0058
Land Pattern Number	90-0175
THERMAL RESISTANCE, FOUR-LAYER BOARD	
Junction to Ambient (θ _{JA})	115°C/W
Junction to Case (θ _{JC})	80°C/W

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to <http://www.maximintegrated.com/thermal-tutorial>.

Electrical Characteristics

(V+ = +12V, C_L = 0F, T_A = T_J = -40°C to +125°C, unless otherwise noted. Typical values are at T_A = +25°C. Parameters specified at V+ = +4.5V apply to the MAX15070A only; see Figure 1.) (Note 2)

PARAMETER	SYMBOL	CONDITIONS		MIN	TYP	MAX	UNITS
POWER SUPPLY (V+)							
Input Voltage Range		MAX15070A		4		14	V
		MAX15070B		6		14	
Undervoltage Lockout	V _{UVLO}	V+ rising		3.3	3.45	3.6	V
Undervoltage-Lockout Hysteresis				200			mV
Undervoltage Lockout to Output Rising Delay		V+ rising		100			μs
Undervoltage Lockout to Output Falling Delay		V+ falling		2			μs
Supply Current	I _{V+}	V+ = 14V, no switching		0.5		1	mA

MAX15070A/MAX15070B

7A Sink, 3A Source,
12ns, SOT23 MOSFET Drivers

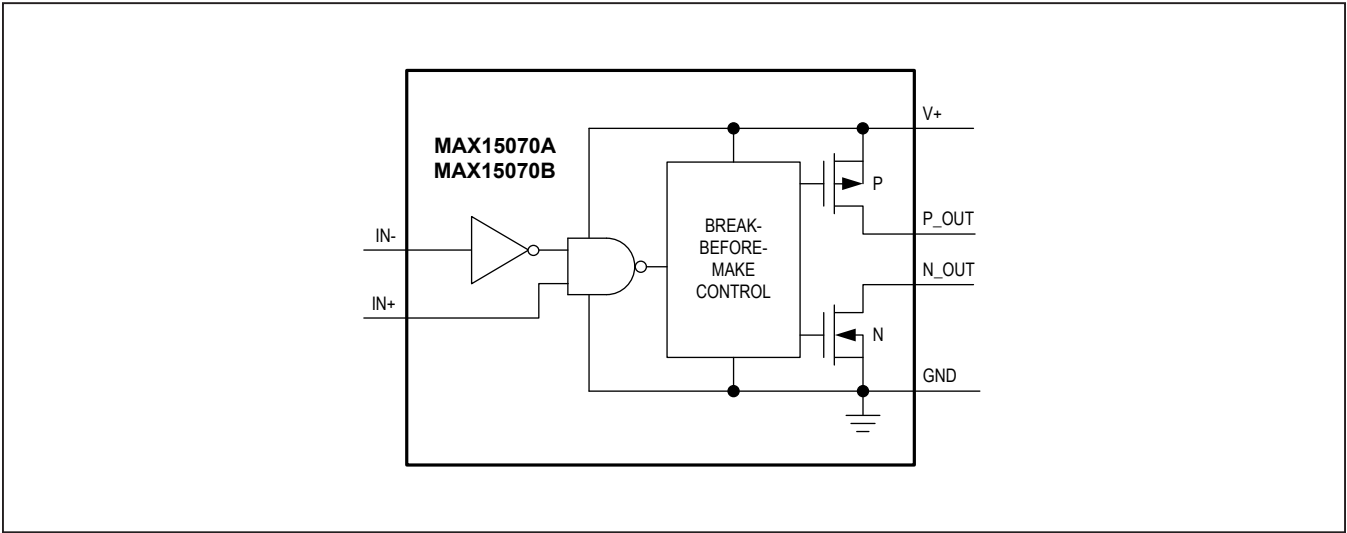

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1	IN+	Noninverting Logic Input. Connect IN+ to V+ when not used.
2	GND	Ground
3	IN-	Inverting Logic Input. Connect IN- to GND when not used.
4	N_OUT	Driver Sink Output. Open-drain n-channel output. Sinks current for power MOSFET turn-off.
5	P_OUT	Driver Source Output. Open-drain p-channel output. Sources current for power MOSFET turn-on.
6	V+	Power-Supply Input. Bypass V+ to GND with a 1μF low-ESR ceramic capacitor.

Functional Diagram

Figure 1. Timing Diagram and Test Circuit

Detailed Description

Logic Inputs

The MAX15070A/MAX15070Bs' logic inputs are protected against voltage spikes up to +16V, regardless of the V+ voltage. The low 10pF input capacitance of the inputs reduces loading and increases switching speed. These ICs have two inputs that give the user greater flexibility in controlling the MOSFET. Table 1 shows all possible input combinations. The difference between the MAX15070A and the MAX15070B is the input threshold voltage. The MAX15070A has TTL logic-level thresholds, while the

MAX15070B has HNM (CMOS-like) logic-level thresholds (see the *Electrical Characteristics*). Connect IN+ to V+ or IN- to GND when not used. Alternatively, the unused input can be used as an on/off control input (Table 1).

Undervoltage Lockout (UVLO)

When V+ is below the UVLO threshold, the n-channel is on and the p-channel is off, independent of the state of the inputs. The UVLO is typically 3.45V with 200mV typical hysteresis to avoid chattering. A typical falling delay of 2μs makes the UVLO immune to narrow negative transients in noisy environments.

Driver Outputs

The ICs provide two separate outputs. One is an open-drain p-channel, the other an open-drain n-channel. They have distinct current sourcing/sinking capabilities to independently control the rise and fall times of the MOSFET gate. Add a resistor in series with P_OUT/N_OUT to slow the corresponding rise/fall time of the MOSFET gate.

Table 1. Truth Table

IN+	IN-	p-CHANNEL	n-CHANNEL
L	L	Off	On
L	H	Off	On
H	L	On	Off
H	H	Off	On

L = Logic-low, H = Logic-high.

Applications Information

Supply Bypassing, Device Grounding, and Placement

Ample supply bypassing and device grounding are extremely important because when large external capacitive loads are driven, the peak current at the V+ pin can approach 3A, while at the GND pin, the peak current can approach 7A. V_{CC} drops and ground shifts are forms of negative feedback for inverters and, if excessive, can cause multiple switching when the IN- input is used and the input slew rate is low. The device driving the input should be referenced to the ICs' GND pin, especially when the IN- input is used. Ground shifts due to insufficient device grounding can disturb other circuits sharing the same AC ground return path. Any series inductance in the V+, P_OUT, N_OUT, and/or GND paths can cause oscillations due to the very high di/dt that results when the ICs are switched with any capacitive load. A 1μF or larger value ceramic capacitor is recommended, bypassing V+ to GND and placed as close as possible to the pins. When driving very large loads (e.g., 10nF) at minimum rise time, 10μF or more of parallel storage capacitance is recommended. A ground plane is highly recommended to minimize ground return resistance and series inductance. Care should be taken to place the ICs as close as possible to the external MOSFET being driven to further minimize board inductance and AC path resistance.

Power Dissipation

Power dissipation of the ICs consists of three components, caused by the quiescent current, capacitive charge and discharge of internal nodes, and the output current (either capacitive or resistive load). The sum of these components must be kept below the maximum power-dissipation limit of the package at the operating temperature.

The quiescent current is 0.5mA typical. The current required to charge and discharge the internal nodes is frequency dependent (see the *Typical Operating Characteristics*).

For capacitive loads, the total power dissipation is approximately:

$$P = C_{LOAD} \times (V+)^2 \times FREQ$$

where C_{LOAD} is the capacitive load, V+ is the supply voltage, and FREQ is the switching frequency.

Layout Information

The ICs' MOSFET drivers source and sink large currents to create very fast rise and fall edges at the gate of the switching MOSFET. The high di/dt can cause unacceptable ringing if the trace lengths and impedances are not well controlled. The following PCB layout guidelines are recommended when designing with the ICs:

- Place one or more 1μF decoupling ceramic capacitor(s) from V+ to GND as close as possible to the IC. At least one storage capacitor of 10μF (min) should be located on the PCB with a low resistance path to the V+ pin of the ICs. There are two AC current loops formed between the IC and the gate of the MOSFET being driven. The MOSFET looks like a large capacitance from gate to source when the gate is being pulled low. The active current loop is from N_OUT of the ICs to the MOSFET gate to the MOSFET source and to GND of the ICs. When the gate of the MOSFET is being pulled high, the active current loop is from P_OUT of the ICs to the MOSFET gate to the MOSFET source to the GND terminal of the decoupling capacitor to the V+ terminal of the decoupling capacitor and to the V+ terminal of the ICs. While the charging current loop is important, the discharging current loop is critical. It is important to minimize the physical distance and the impedance in these AC current paths.
- In a multilayer PCB, the component surface layer surrounding the ICs should consist of a GND plane containing the discharging and charging current loops.

Ordering Information

PART	INPUT LOGIC LEVELS	PIN-PACKAGE
MAX15070AAUT+	TTL	6 SOT23
MAX15070AAUT/V+	TTL	6 SOT23
MAX15070BAUT+	HNM	6 SOT23

Note: All devices are specified over the -40°C to +125°C operating temperature range.

+Denotes a lead(Pb)-free/RoHS-compliant package.

/V Denotes an automotive-qualified part.
