ABSOLUTE MAXIMUM RATINGS

V _{DD} to GND	-0.3V to +6.0V
All Other Pins to GND	-0.3V to (V _{DD} + 0.3V)
Maximum Continuous Current into H, L, and W	
MAX5417	±1.3mA
MAX5418	±0.6mA
MAX5419	±0.3mA

Continuous Power Dissipation (T _A = +70°C)	
8-Pin TDFN (derate 24.4mW/°C above +70°C)	1951mW
Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-60°C to +150°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow)	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Note 1: The DNL and INL are measured with the potentiometer configured as a voltage-divider with H = V_{DD} and L = GND. The wiper terminal is unloaded and measured with a high-input-impedance voltmeter.

Note 2: The DNL and INL are measured with the potentiometer configured as a variable resistor. H is unconnected and L = GND. For the 5V condition, the wiper terminal is driven with a source current of 80μA for the 50kΩ configuration, 40μA for the 100kΩ configuration, and 20μA for the 200kΩ configuration. For the 3V condition, the wiper terminal is driven with a source current of 40μA for the 50kΩ configuration, 20μA for the 100kΩ configuration, and 10μA for the 200kΩ configuration.

Note 3: The wiper resistance is measured using the source currents given in Note 2. For operation to V_{DD} = 2.7V, see Wiper Resistance vs. Temperature in the *Typical Operating Characteristics*.

Note 4: The device draws higher supply current when the digital inputs are driven with voltages between (V_{DD} - 0.5V) and (GND + 0.5V). See Supply Current vs. Digital Input Voltage in the *Typical Operating Characteristics*.

Note 5: Wiper at midscale with a 10pF load (DC measurement). L = GND; an AC source is applied to H; and the W output is measured. A 3dB bandwidth occurs when the AC W/H value is 3dB lower than the DC W/H value.

Note 6: The programming current operates only during power-up and NV writes.

Note 7: SCL clock period includes rise and fall times t_R and t_F. All digital input signals are specified with t_R = t_F = 2ns and timed from a voltage level of (V_{IL} + V_{IH}) / 2.

Note 8: Wiper settling time is the worst-case 0% to 50% rise time measured between consecutive wiper positions. H = V_{DD}, L = GND, and the wiper terminal is unloaded and measured with a 10pF oscilloscope probe (see the *Typical Operating Characteristics* for the tap-to-tap switching transient).

Note 9: An appropriate bus pullup resistance must be selected depending on board capacitance. Refer to the document linked to this web address: www.semiconductors.philips.com/acrobat/literature/9398/39340011.pdf.

Note 10: The idle time begins from the initiation of the stop pulse.

Pin Description

PIN	NAME	FUNCTION
1	V _{DD}	Power-Supply Input. 2.7V to 5.25V voltage range. Bypass with a 0.1μF capacitor from V _{DD} to GND.
2	SCL	I ² C-Interface Clock Input
3	SDA	I ² C-Interface Data Input
4	A ₀	Address Input. Sets the A ₀ bit in the device ID address.
5	GND	Ground
6	L	Low Terminal
7	W	Wiper Terminal
8	H	High Terminal
—	EP	Exposed Pad. Internally connected to GND. Connect to a large ground plane to maximize thermal performance. Not intended as an electrical point.

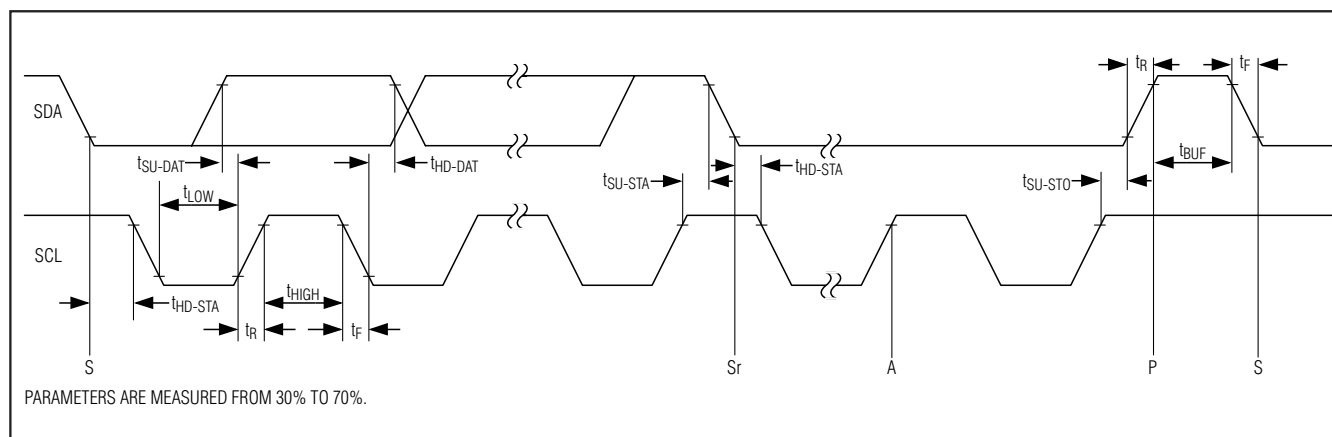

Figure 1. I²C Serial-Interface Timing Diagram

Figure 2. Load Circuit

Detailed Description

The MAX5417/MAX5418/MAX5419 contain a resistor array with 255 resistive elements. The MAX5417 has a total end-to-end resistance of 50kΩ, the MAX5418 has an end-to-end resistance of 100kΩ, and the MAX5419 has an end-to-end resistance of 200kΩ. The MAX5417/MAX5418/MAX5419 allow access to the high, low, and wiper terminals for a standard voltage-divider configuration. H, L, and W can be connected in any desired configuration as long as their voltages fall between GND and V_{DD}.

A simple 2-wire I²C-compatible serial interface moves the wiper among the 256 tap points. A nonvolatile memory stores the wiper position and recalls the stored wiper position in the nonvolatile memory upon power-up. The nonvolatile memory is guaranteed for 50 years for wiper data retention and up to 200,000 wiper store cycles.

256-Tap, Nonvolatile, I²C-Interface, Digital Potentiometers

Analog Circuitry

The MAX5417/MAX5418/MAX5419 consist of a resistor array with 255 resistive elements; 256 tap points are accessible to the wiper, W, along the resistor string between H and L. The wiper tap point is selected by programming the potentiometer through the 2-wire (I²C) interface. Eight data bits, an address byte, and a control byte program the wiper position. The H and L terminals of the MAX5417/MAX5418/MAX5419 are similar to the two end terminals of a mechanical potentiometer. The MAX5417/MAX5418/MAX5419 feature power-on reset circuitry that loads the wiper position from non-volatile memory at power-up.

Digital Interface

The MAX5417/MAX5418/MAX5419 feature an internal, nonvolatile EEPROM that stores the wiper state for initialization during power-up. The shift register decodes the control and address bits, routing the data to the proper memory registers. Data can be written to a volatile memory register, immediately updating the wiper position, or data can be written to a nonvolatile register for storage.

The volatile register retains data as long as the device is powered. Once power is removed, the volatile register is cleared. The nonvolatile register retains data even after power is removed. Upon power-up, the power-on reset circuitry controls the transfer of data from the non-volatile register to the volatile register.

Serial Addressing

The MAX5417/MAX5418/MAX5419 operate as a slave that receives data through an I²C- and SMBus™-compatible 2-wire interface. The interface uses a serial data access (SDA) line and a serial clock line (SCL) to achieve communication between master(s) and slave(s). A master, typically a microcontroller, initiates all data transfers to the MAX5417/MAX5418/MAX5419, and generates the SCL clock that synchronizes the data transfer (Figure 1).

The MAX5417/MAX5418/MAX5419 SDA line operates as both an input and an open-drain output. A pullup resistor, typically 4.7kΩ, is required on the SDA bus. The MAX5417/MAX5418/MAX5419 SCL operates only as an input. A pullup resistor, typically 4.7kΩ, is required on the SCL bus if there are multiple masters on the 2-wire interface, or if the master in a single-master system has an open-drain SCL output.

Each transmission consists of a START (S) condition (Figure 3) sent by a master, followed by the MAX5417/MAX5418/MAX5419 7-bit slave address plus the 8th bit (Figure 4), 1 command byte (Figure 7) and 1 data byte, and finally a STOP (P) condition (Figure 3).

Start and Stop Conditions

Both SCL and SDA remain high when the interface is not busy. A master signals the beginning of a transmission with a START condition by transitioning SDA from high to low while SCL is high. When the master has finished communicating with the slave, it issues a STOP condition by transitioning the SDA from low to high while SCL is high. The bus is then free for another transmission (Figure 3).

Bit Transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable while SCL is high (Figure 5).

Figure 3. Start and Stop Conditions

Figure 4. Slave Address

256-Tap, Nonvolatile, I²C-Interface, Digital Potentiometers

Table 1. MAX5417/MAX5418/MAX5419 Address Codes

ADDRESS BYTE								
PART SUFFIX	A6	A5	A4	A3	A2	A1	A0	NOP/ \overline{W}
L	0	1	0	1	0	0	0	NOP/ \overline{W}
L	0	1	0	1	0	0	1	NOP/ \overline{W}
M	0	1	0	1	0	1	0	NOP/ \overline{W}
M	0	1	0	1	0	1	1	NOP/ \overline{W}
N	0	1	0	1	1	0	0	NOP/ \overline{W}
N	0	1	0	1	1	0	1	NOP/ \overline{W}
P	0	1	0	1	1	1	0	NOP/ \overline{W}
P	0	1	0	1	1	1	1	NOP/ \overline{W}

Acknowledge

The acknowledge bit is a clocked 9th bit that the recipient uses to handshake receipt of each byte of data (Figure 6). Thus, each byte transferred effectively requires 9 bits. The master generates the 9th clock pulse, and the recipient pulls down SDA during the acknowledge clock pulse, so the SDA line is stable low during the high period of the clock pulse. When the master transmits to the MAX5417/MAX5418/MAX5419, the devices generate the acknowledge bit because the MAX5417/MAX5418/MAX5419 are the recipients.

Slave Address

The MAX5417/MAX5418/MAX5419 have a 7-bit-long slave address (Figure 4). The 8th bit following the 7-bit

slave address is the NOP/ \overline{W} bit. Set the NOP/ \overline{W} bit low for a write command and high for a no-operation command.

The MAX5417/MAX5418/MAX5419 are available in one of four possible slave addresses (Table 1). The first 4 bits (MSBs) of the MAX5417/MAX5418/MAX5419 slave addresses are always 0101. The next 2 bits are factory programmed (see Table 1). Connect the A₀ input to either GND or V_{DD} to toggle between two unique device addresses for a part. Each device must have a unique address to share the bus. Therefore, a maximum of eight MAX5417/MAX5418/MAX5419 devices can share the same bus.

Figure 5. Bit Transfer

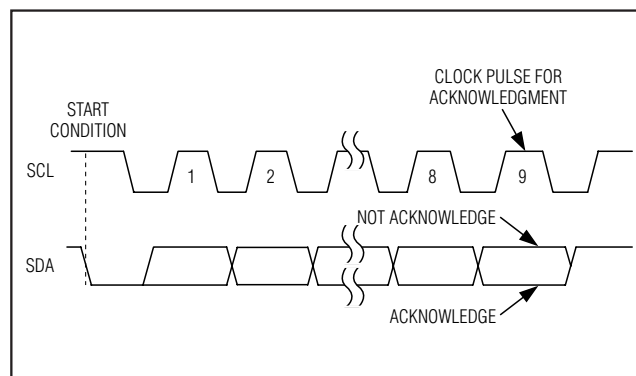

Figure 6. Acknowledge

256-Tap, Nonvolatile, I²C-Interface, Digital Potentiometers

Figure 7. Command Byte Received

Figure 8. Command and Single Data Byte Received

Message Format for Writing

A write to the MAX5417/MAX5418/MAX5419 consists of the transmission of the device's slave address with the 8th bit set to zero, followed by at least 1 byte of information (Figure 7). The 1st byte of information is the command byte. The bytes received after the command byte are the data bytes. The 1st data byte goes into the internal register of the MAX5417/MAX5418/MAX5419 as selected by the command byte (Figure 8).

Command Byte

Use the command byte to select the source and destination of the wiper data (nonvolatile or volatile memory registers) and swap data between nonvolatile and volatile memory registers (see Table 2).

Command Descriptions

VREG: The data byte writes to the volatile memory register and the wiper position updates with the data in the volatile memory register.

NVREG: The data byte writes to the nonvolatile memory register. The wiper position is unchanged.

NVREGxVREG: Data transfers from the nonvolatile memory register to the volatile memory register (wiper position updates).

VREGxNVREG: Data transfers from the volatile memory register into the nonvolatile memory register.

X = Don't care.

Nonvolatile Memory

The internal EEPROM consists of an 8-bit nonvolatile register that retains the value written to it before the device is powered down. The nonvolatile register is programmed with the midscale value at the factory.

Power-Up

Upon power-up, the MAX5417/MAX5418/MAX5419 load the data stored in the nonvolatile memory register into the volatile memory register, updating the wiper position with the data stored in the nonvolatile memory register. This initialization period takes 10μs.

Standby

The MAX5417/MAX5418/MAX5419 feature a low-power standby. When the device is not being programmed, it goes into standby mode and power consumption is typically 500nA.

Applications Information

The MAX5417/MAX5418/MAX5419 are intended for circuits requiring digitally controlled adjustable resistance, such as LCD contrast control (where voltage biasing adjusts the display contrast), or for programmable filters with adjustable gain and/or cutoff frequency.

Positive LCD Bias Control

Figures 9 and 10 show an application where the voltage-divider or variable resistor is used to make an adjustable, positive LCD bias voltage. The op amp provides buffering and gain to the resistor-divider network made by the potentiometer (Figure 9) or to a fixed resistor and a variable resistor (see Figure 10).

Programmable Filter

Figure 11 shows the configuration for a 1st-order programmable filter. The gain of the filter is adjusted by R2, and the cutoff frequency is adjusted by R3. Use the following equations to calculate the gain (G) and the 3dB cutoff frequency (f_c):

$$G = 1 + \frac{R1}{R2}$$

$$f_c = \frac{1}{2\pi \times R3 \times C}$$

Figure 9. Positive LCD Bias Control Using a Voltage-Divider

256-Tap, Nonvolatile, I²C-Interface, Digital Potentiometers

Figure 11. Programmable Filter

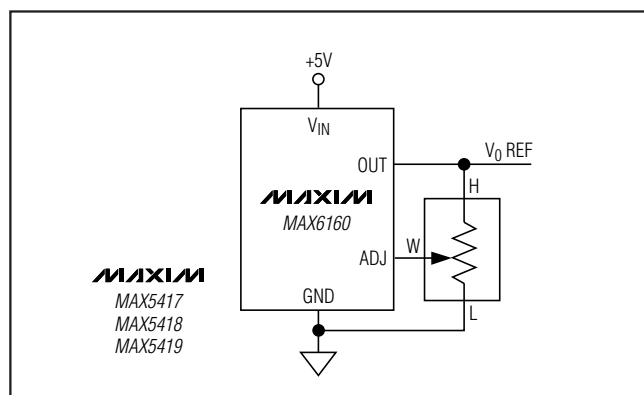

Figure 12. Adjustable Voltage Reference

Adjustable Voltage Reference

Figure 12 shows the MAX5417/MAX5418/MAX5419 used as the feedback resistors in multiple adjustable voltage-reference applications. Independently adjust the output voltage of the MAX6160 from 1.23V to $V_{IN} - 0.2V$ by changing the wiper positions of the MAX5417/MAX5418/MAX5419.

Offset Voltage and Gain Adjustment

Connect the high and low terminals of one potentiometer of a MAX5417 between the NULL inputs of a MAX410 and the wiper to the op amp's positive supply to nullify the offset voltage over the operating temperature range. Install the other potentiometer in the feedback path to adjust the gain of the MAX410 (see Figure 13).
