 Lead Temperature (soldering, 10s)+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = +3.0V to +3.6V, R_L = 27Ω ±1%, EN = high, $\overline{\text{EN}}$ = low, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at V_{CC} = +3.3V, T_A = +25°C.) (Notes 1, 2)

Note 1: Maximum and minimum limits over temperature are guaranteed by design and characterization. Devices are 100% tested at $T_A = +25^\circ\text{C}$.

Note 2: Current into the device is defined as positive, and current out of the device is defined as negative. All voltages are referenced to ground except V_{OD} and ΔV_{OD} .

Note 3: AC parameters are guaranteed by design and characterization.

Note 4: C_L includes probe and jig capacitance.

Note 5: Signal generator conditions: $V_{OL} = 0$, $V_{OH} = V_{CC}$, $f = 100\text{MHz}$, 50% duty cycle, $R_O = 50\Omega$, $t_R = t_F = 1\text{ns}$ (10% to 90%).

Note 6: t_{SKD1} is the magnitude difference of differential propagation delays. $t_{SKD1} = |t_{PHLD} - t_{PLHD}|$.

Note 7: t_{SKD2} is the magnitude difference of t_{PHLD} or t_{PLHD} of one channel to the t_{PHLD} or t_{PLHD} of another channel on the same device.

Note 8: t_{SKD3} is the magnitude difference of any differential propagation delays between devices at the same V_{CC} and within 5°C of each other.

Note 9: t_{SKD4} is the magnitude difference of any differential propagation delays between devices operating over the rated supply and temperature ranges.

Note 10: Signal generator conditions: $V_{OL} = 0$, $V_{OH} = V_{CC}$, $f = 100\text{MHz}$, 50% duty cycle, $R_O = 50\Omega$, $t_R = t_F = 1\text{ns}$ (10% to 90%). MAX9129 output criteria: duty cycle = 45% to 55%, $V_{OD} \geq 250\text{mV}$, all channels switching.

Detailed Description

The MAX9129 is a 200Mbps quad differential BLVDS driver designed for multipoint, heavily loaded backplane applications. This device accepts LVTTTL/LVCMOS input levels and translates them to output levels of 250mV to 450mV into a 27Ω load. The flow-through pinout simplifies board layout and reduces the potential for crosstalk between single-ended inputs and differential outputs. Transition times are designed to reduce reflections, yet enable high data rates. The MAX9129 can be used in conjunction with standard quad LVDS receivers, such

as the MAX9121, to implement full-duplex multipoint buses more efficiently than with transceivers.

Effect of Capacitive Loading

The characteristic impedance of a differential PC board trace is uniformly reduced when equal capacitive loads are attached at equal intervals (provided the transition time of the signal being driven on the trace is longer than the delay between loads). This kind of loading is typical of multipoint buses where cards are attached at 1in or 0.8in intervals along the length of a backplane.

Quad Bus LVDS Driver with Flow-Through Pinout

The reduction in characteristic impedance is approximated by the following formula:

$$Z_{\text{DIFF-loaded}} = Z_{\text{DIFF-unloaded}} \times \text{SQRT} [C_o / (C_o + N \times C_L / L)]$$

where:

$Z_{\text{DIFF-unloaded}}$ = unloaded differential characteristic impedance

C_o = unloaded trace capacitance (pF/unit length)

C_L = value of each capacitive load (pF)

N = number of capacitive loads

L = trace length

For example, if $C_o = 2.5\text{pF/in}$, $C_L = 10\text{pF}$, $N = 18$, $L = 18\text{in}$, and $Z_{\text{DIFF-unloaded}} = 120\Omega$, the loaded differential impedance is:

$$Z_{\text{DIFF-loaded}} = 120\Omega \times \text{SQRT} [2.5\text{pF} / (2.5\text{pF} + 18 \times 10\text{pF}/18\text{in})]$$

$$Z_{\text{DIFF-loaded}} = 54\Omega$$

In this example, capacitive loading reduces the characteristic impedance from 120Ω to 54Ω . The load seen by a driver located on a card in the middle of the bus is 27Ω because the driver sees two 54Ω loads in parallel. A typical LVDS driver (rated for a 100Ω load) would not develop a large enough differential signal to be reliably detected by an LVDS receiver. Maxim's BLVDS driver is designed and specified to drive a 27Ω load to differential voltage levels of 250mV to 450mV (which are standard LVDS driver levels). A standard LVDS receiver is able to detect this level of differential signal.

Short extensions off the bus, called stubs, contribute to capacitive loading. Keep stubs less than 1in for a good balance between ease of component placement and good signal integrity.

The MAX9129 is a current source driver and drives larger differential signal levels into loads higher than 27Ω and smaller levels into loads less than 27Ω (see typical operating curves). To keep loading from reducing bus impedance below the rated 27Ω load, PC board traces can be designed for higher unloaded characteristic impedance.

Effect of Transition Time

For transition times (measured from 0% to 100%) shorter than the delay between capacitive loads, the loads are seen as low-impedance discontinuities from which the driven signal is reflected. Reflections add and subtract from the signal being driven and cause decreased noise margin and jitter. The MAX9129 is designed for a

minimum transition time of 1ns (rated 0.6ns from 20% to 80%, or about 1ns 0% to 100%) to reduce reflections while being fast enough for high-speed backplane data transmission.

Power-On Reset

The power-on reset voltage of the MAX9129 is typically 2.25V. When the supply falls below this voltage, the device is disabled and the outputs are in high impedance.

Applications Information

Power-Supply Bypassing

Bypass V_{CC} with high-frequency, surface-mount ceramic 0.1 μF and 0.001 μF capacitors in parallel as close to the device as possible, with the smaller valued capacitor closest to V_{CC} .

Termination

In the example above, the loaded differential impedance of the bus is reduced to 54Ω . Since it can be driven from any card position, the bus must be terminated at each end. A parallel termination of 54Ω at each end of the bus placed across the traces that make up the differential pair provides a proper termination. The total load seen by the driver is 27Ω .

The MAX9129 drives higher differential signal levels into lighter loads. A multidrop bus with the driver at one end and receivers connected at regular intervals along the bus has a lowered impedance due to capacitive loading. Assuming the same impedance calculated in the multidrop example above (54Ω), the multidrop bus can be terminated with a single, parallel-connected 54Ω resistor at the far end from the driver. Only a single resistor is required because the driver sees one 54Ω differential trace. The signal swing is larger with a 54Ω load.

In general, parallel terminate each end of the bus with a resistor matching the differential impedance of the bus (taking into account any reduced impedance due to loading).

Board Layout

A four-layer PC board that provides separate power, ground, input, and output signals is recommended. Keep the LVTTTL/LVCMOS and BLVDS signals separated to prevent coupling as shown in the suggested layout for the QFN package (not drawn to scale) (Figure 6).

NOTES:

1. DIE THICKNESS ALLOWABLE IS 0.305mm MAXIMUM (.012 INCHES MAXIMUM)
2. DIMENSIONING & TOLERANCES CONFORM MUST TO ASME Y14.5M. – 1994.
3. N IS THE NUMBER OF TERMINALS.
Nd IS THE NUMBER OF TERMINALS IN X-DIRECTION &
Ne IS THE NUMBER OF TERMINALS IN Y-DIRECTION.
4. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.20 AND 0.25mm FROM TERMINAL TIP.
5. THE PIN #1 IDENTIFIER MUST BE EXISTED ON THE TOP SURFACE OF THE PACKAGE BY USING INDENTATION MARK OR OTHER FEATURE OF PACKAGE BODY.
6. EXACT SHAPE AND SIZE OF THIS FEATURE IS OPTIONAL.
7. ALL DIMENSIONS ARE IN MILLIMETERS.
8. THE SHAPE SHOWN ON FOUR CORNERS ARE NOT ACTUAL 1/0.
9. PACKAGE WARPAGE MAX 0.05mm.
10. APPLIED FOR EXPOSED PAD AND TERMINALS.
EXCLUDE EMBEDDING PART OF EXPOSED PAD FROM MEASURING.
11. APPLIED ONLY FOR TERMINALS.
12. MEETS JEDEC MO220.
