3.1 Analog Inputs

The comparator non-inverting and inverting inputs are high-impedance CMOS inputs with low bias currents.

3.2 $\overline{CS}$ Digital Input

This is a CMOS, Schmitt-triggered input that places the part into a low-power mode of operation.

3.3 Digital Outputs

The comparator outputs are CMOS, push-pull digital outputs. They are designed to be compatible with CMOS and TTL logic and are capable of driving heavy DC or capacitive loads.

3.4 Power Supply (V_{SS} and V_{DD})

The positive power supply pin (V_{DD}) is 1.6V to 5.5V higher than the negative power supply pin (V_{SS}). For normal operation, the other pins are at voltages between V_{SS} and V_{DD}.

Typically, these parts are used in a single (positive) supply configuration. In this case, V_{SS} is connected to ground and V_{DD} is connected to the supply. V_{DD} will need a local bypass capacitor (typically 0.01 µF to 0.1 µF) within 2 mm of the V_{DD} pin. These can share a bulk capacitor with nearby analog parts (within 100 mm), but it is not required.

NOTES:

4.0 APPLICATIONS INFORMATION

The MCP6541/1R/1U/2/3/4 family of push-pull output comparators are fabricated on Microchip's state-of-the-art CMOS process. They are suitable for a wide range of applications requiring very low-power consumption.

4.1 Comparator Inputs

4.1.1 PHASE REVERSAL

The MCP6541/1R/1U/2/3/4 comparator family uses CMOS transistors at the input. They are designed to prevent phase inversion when the input pins exceed the supply voltages. Figure 2-3 shows an input voltage exceeding both supplies with no resulting phase inversion.

4.1.2 INPUT VOLTAGE AND CURRENT LIMITS

The ESD protection on the inputs can be depicted as shown in Figure 4-1. This structure was chosen to protect the input transistors, and to minimize input bias current (IB). The input ESD diodes clamp the inputs when they try to go more than one diode drop below V_{SS}. They also clamp any voltages that go too far above V_{DD}; their breakdown voltage is high enough to allow normal operation, and low enough to bypass ESD events within the specified limits.

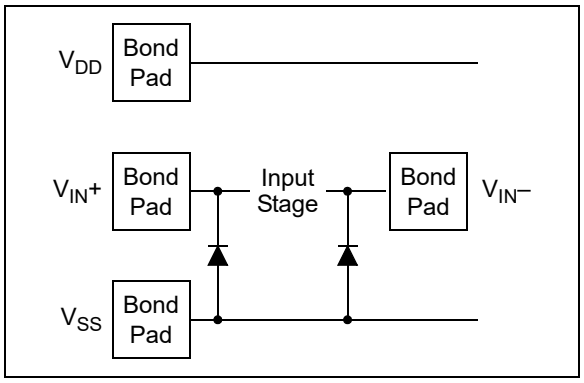

FIGURE 4-1: *Simplified Analog Input ESD Structures.*

In order to prevent damage and/or improper operation of these amplifiers, the circuits they are in must limit the currents (and voltages) at the V_{IN}+ and V_{IN}– pins (see Absolute Maximum Ratings † at the beginning of **Section 1.0 "Electrical Characteristics"**). Figure 4-3 shows the recommended approach to protecting these inputs. The internal ESD diodes prevent the input pins (V_{IN}+ and V_{IN}–) from going too far below ground, and the resistors R_1 and R_2, limit the possible current drawn out of the input pin. Diodes D_1 and D_2 prevent the input pin (V_{IN}+ and V_{IN}–) from going too far above V_{DD}. When implemented as shown, resistors R_1 and R_2 also limit the current through D_1 and D_2.

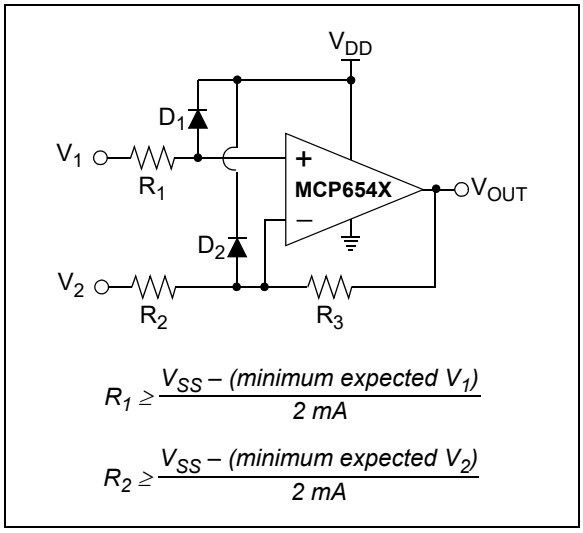

FIGURE 4-2: *Protecting the Analog Inputs.*

It is also possible to connect the diodes to the left of the resistors R_1 and R_2. In this case, the currents through the diodes D_1 and D_2 need to be limited by some other mechanism. The resistor then serves as in-rush current limiter; the DC current into the input pins (V_{IN}+ and V_{IN}–) should be very small.

A significant amount of current can flow out of the inputs when the Common-mode voltage (V_{CM}) is below ground (V_{SS}); see Figure 2-37. Applications that are high-impedance may need to limit the usable voltage range.

4.1.3 NORMAL OPERATION

The input stage of this family of devices uses two differential input stages in parallel: one operates at low input voltages and the other at high input voltages. With this topology, the input voltage is 0.3V above V_{DD} and 0.3V below V_{SS}. Therefore, the input offset voltage is measured at both V_{SS} - 0.3V and V_{DD} + 0.3V to ensure proper operation.

The MCP6541/1R/1U/2/3/4 family has internally-set hysteresis that is small enough to maintain input offset accuracy (<7 mV) and large enough to eliminate output chattering caused by the comparator's own input noise voltage (200 μV_{p-p}). Figure 4-3 depicts this behavior.

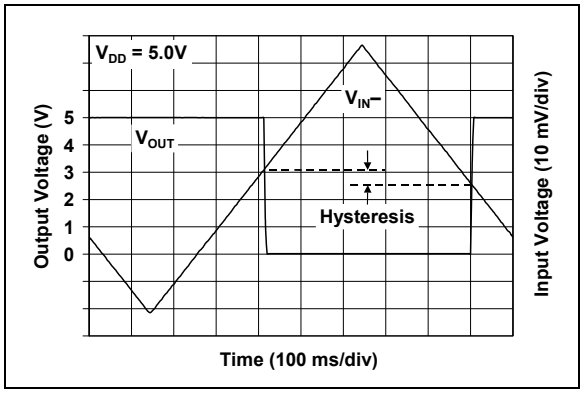

FIGURE 4-3: *The MCP6541/1R/1U/2/3/4 comparators' internal hysteresis eliminates output chatter caused by input noise voltage.*

4.2 Push-Pull Output

The push-pull output is designed to be compatible with CMOS and TTL logic, while the output transistors are configured to give rail-to-rail output performance. They are driven with circuitry that minimizes any switching current (shoot-through current from supply-to-supply) when the output is transitioned from high-to-low, or from low-to-high (see Figures 2-15, 2-18, and 2-32 — 2-36 for more information).

4.3 MCP6543 Chip Select ($\overline{CS}$)

The MCP6543 is a single comparator with Chip Select ($\overline{CS}$). When $\overline{CS}$ is pulled high, the total current consumption drops to 20 pA (typ.); 1 pA (typ.) flows through the $\overline{CS}$ pin, 1 pA (typ.) flows through the output pin and 18 pA (typ.) flows through the V_{DD} pin, as shown in Figure 1-1. When this happens, the comparator output is put into a high-impedance state. By pulling $\overline{CS}$ low, the comparator is enabled. If the $\overline{CS}$ pin is left floating, the comparator will not operate properly. Figure 1-1 shows the output voltage and supply current response to a $\overline{CS}$ pulse.

The internal $\overline{CS}$ circuitry is designed to minimize glitches when cycling the $\overline{CS}$ pin. This helps conserve power, which is especially important in battery-powered applications.

4.4 Externally Set Hysteresis

Greater flexibility in selecting hysteresis (or input trip points) is achieved by using external resistors.

Input offset voltage (V_{OS}) is the center (average) of the (input-referred) low-high and high-low trip points. Input hysteresis voltage (V_{HYST}) is the difference between the same trip points. Hysteresis reduces output chattering when one input is slowly moving past the other and thus reduces dynamic supply current. It also helps in systems where it is best not to cycle between states too frequently (e.g., air conditioner thermostatic control).

4.4.1 NON-INVERTING CIRCUIT

Figure 4-4 shows a non-inverting circuit for single-supply applications using just two resistors. The resulting hysteresis diagram is shown in Figure 4-5.

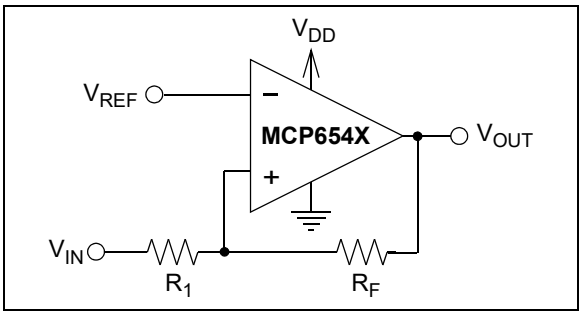

FIGURE 4-4: *Noninverting Circuit with Hysteresis for Single-supply.*

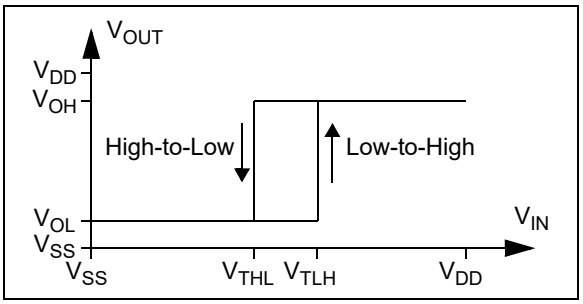

FIGURE 4-5: *Hysteresis Diagram for the Noninverting Circuit.*

The trip points for Figures 4-4 and 4-5 are:

EQUATION 4-1:

$$V_{TLH} = V_{REF}\left(1+\frac{R_1}{R_F}\right) - V_{OL}\left(\frac{R_1}{R_F}\right)$$

$$V_{THL} = V_{REF}\left(1+\frac{R_1}{R_F}\right) - V_{OH}\left(\frac{R_1}{R_F}\right)$$

V_{TLH} = trip voltage from low-to-high

V_{THL} = trip voltage from high-to-low

4.4.2 INVERTING CIRCUIT

Figure 4-6 shows an inverting circuit for single-supply using three resistors. The resulting hysteresis diagram is shown in Figure 4-7.

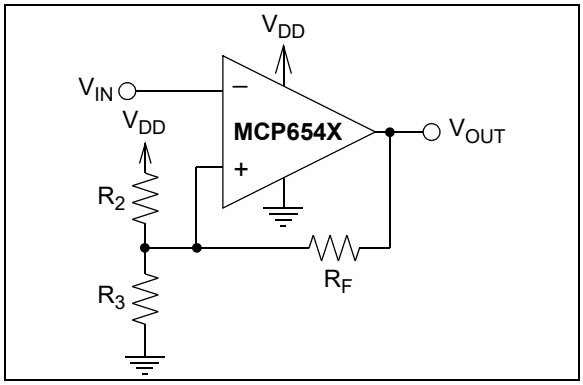

FIGURE 4-6: *Inverting Circuit With Hysteresis.*

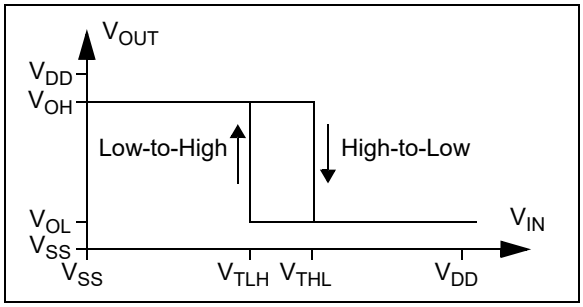

FIGURE 4-7: *Hysteresis Diagram for the Inverting Circuit.*

In order to determine the trip voltages (V_{THL} and V_{TLH}) for the circuit shown in Figure 4-6, R_2 and R_3 can be simplified to the Thevenin equivalent circuit with respect to V_{DD}, as shown in Figure 4-8.

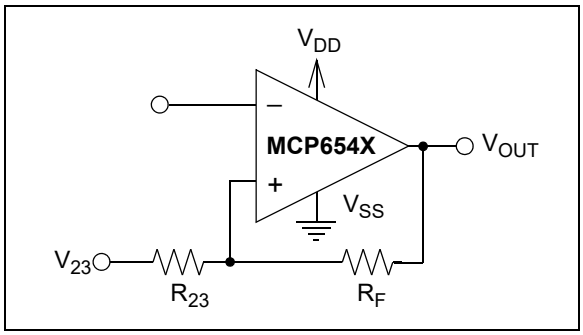

FIGURE 4-8: *Thevenin Equivalent Circuit.*

Where:

$$R_{23} = \frac{R_2 R_3}{R_2 + R_3}$$

$$V_{23} = \frac{R_3}{R_2 + R_3} \times V_{DD}$$

Using this simplified circuit, the trip voltage can be calculated using the following equation:

EQUATION 4-2:

$$V_{THL} = V_{OH}\left(\frac{R_{23}}{R_{23} + R_F}\right) + V_{23}\left(\frac{R_F}{R_{23} + R_F}\right)$$

$$V_{TLH} = V_{OL}\left(\frac{R_{23}}{R_{23} + R_F}\right) + V_{23}\left(\frac{R_F}{R_{23} + R_F}\right)$$

V_{TLH} = trip voltage from low-to-high

V_{THL} = trip voltage from high-to-low

Figure 2-20 and Figure 2-23 can be used to determine typical values for V_{OH} and V_{OL}.

4.5 Bypass Capacitors

With this family of comparators, the power supply pin (V_{DD} for single supply) should have a local bypass capacitor (i.e., 0.01 µF to 0.1 µF) within 2 mm for good edge rate performance.

4.6 Capacitive Loads

Reasonable capacitive loads (e.g., logic gates) have little impact on propagation delay (see Figure 2-31). The supply current increases with increasing toggle frequency (Figure 2-19), especially with higher capacitive loads.

4.7 Battery Life

In order to maximize battery life in portable applications, use large resistors and small capacitive loads. Avoid toggling the output more than necessary. Do not use Chip Select ($\overline{CS}$) frequently to conserve start-up power. Capacitive loads will draw additional power at start-up.

4.8 PCB Surface Leakage

In applications where low input bias current is critical, PCB (Printed Circuit Board) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is $10^{12}\Omega$. A 5V difference would cause 5 pA of current to flow. This is greater than the MCP6541/1R/1U/2/3/4 family's bias current at 25°C (1 pA, typ.).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 4-9.

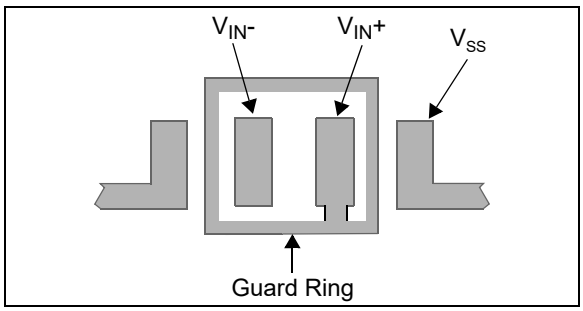

FIGURE 4-9: *Example Guard Ring Layout for Inverting Circuit.*

1. Inverting Configuration (Figures 4-6 and 4-9):
   a. Connect the guard ring to the non-inverting input pin (V_{IN}+). This biases the guard ring to the same reference voltage as the comparator (e.g., V_{DD}/2 or ground).
   b. Connect the inverting pin (V_{IN}–) to the input pad without touching the guard ring.
2. Non-inverting Configuration (Figure 4-4):
   a. Connect the non-inverting pin (V_{IN}+) to the input pad without touching the guard ring.
   b. Connect the guard ring to the inverting input pin (V_{IN}–).

4.9 Unused Comparators

An unused amplifier in a quad package (MCP6544) should be configured as shown in Figure 4-10. This circuit prevents the output from toggling and causing crosstalk. It uses the minimum number of components and draws minimal current (see Figure 2-15 and Figure 2-18).

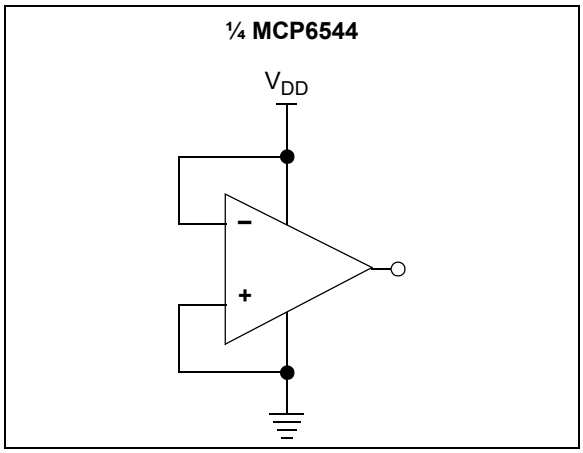

FIGURE 4-10: *Unused Comparators.*

4.10 Typical Applications

4.10.1 PRECISE COMPARATOR

Some applications require higher DC precision. An easy way to solve this problem is to use an amplifier (such as the MCP6041) to gain-up the input signal before it reaches the comparator. Figure 4-11 shows an example of this approach.

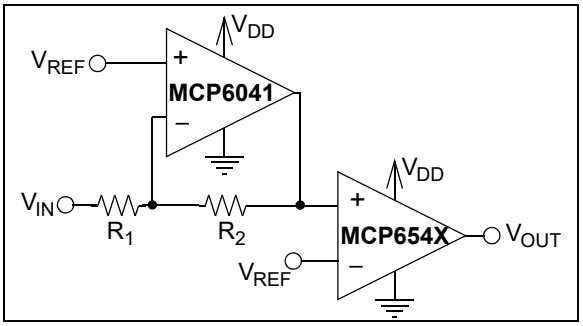

FIGURE 4-11: *Precise Inverting Comparator.*

4.10.2 WINDOWED COMPARATOR

Figure 4-12 shows one approach to designing a windowed comparator. The AND gate produces a logic '1' when the input voltage is between V_{RB} and V_{RT} (where $V_{RT} > V_{RB}$).

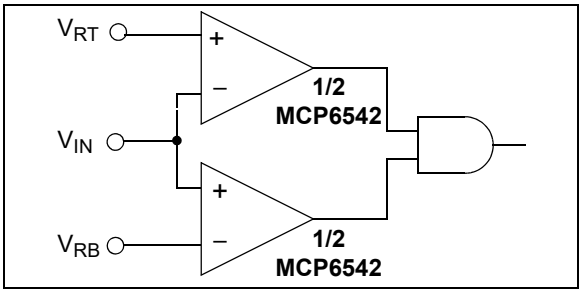

FIGURE 4-12: *Windowed Comparator.*

4.10.3 ASTABLE MULTIVIBRATOR

A simple astable multivibrator design is shown in Figure 4-13. V_{REF} needs to be between the power supplies (V_{SS} = GND and V_{DD}) to achieve oscillation. The output duty cycle changes with V_{REF}.

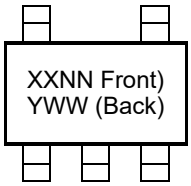
5.0 PACKAGING INFORMATION

5.1 Package Marking Information

5-Lead SC-70 (**MCP6541, MCP6541U**)

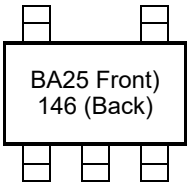


Device	I-Temp Code	E-Temp Code
MCP6541T-I/LT	ABNN	Note 2
MCP6541UT-I/LT	BANN	Note 2

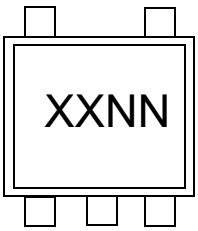
Note 1: I-Temp parts prior to March 2005 are marked “BAN”

2: SC-70-5 E-Temp parts not available at this release of this data sheet.

Example:



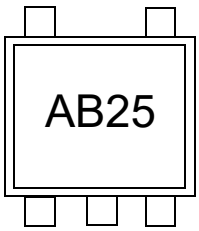
5-Lead SOT-23 **(MCP6541, MCP6541R, MCP6541U)**



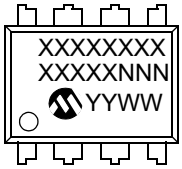
Device	I-Temp Code	E-Temp Code
MCP6541	ABNN	GTNN
MCP6541R	AGNN	GUNN
MCP6541U	—	ATNN

Note: Applies to 5-Lead SOT-23

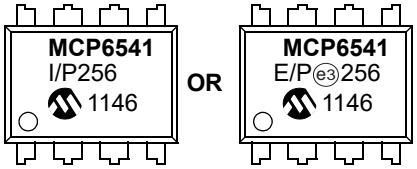
Example:



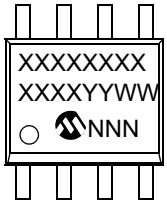
8-Lead PDIP (300 mil) **(MCP6541, MCP6542, MCP6543, MCP6544)**



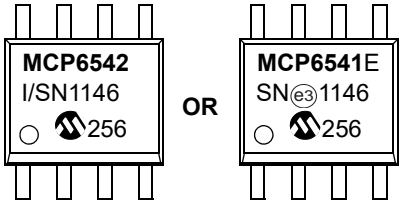
Example:



8-Lead SOIC (150 mil) **(MCP6541, MCP6542, MCP6543, MCP6544)**



Example:



Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
	e3	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

APPENDIX A: REVISION HISTORY

Revision K (March 2020)

The following is the list of modifications:

1. Updated package drawings for the SC-70 package.

Revision J (November 2019)

The following is the list of modifications:

1. Updated **Section 5.0 "Packaging Information"**.

Revision H (December 2011)

The following is the list of modifications:

1. Updated Package Types drawings to correctly show the device representation for the SC-70 package.
1. Updated package's temperatures in the Temperature Characteristics table.
2. Corrected the marking information table for the 5-Lead SC-70 package (MCP6541 and MCP6541U) in **Section 5.1 "Package Marking Information"**.
3. Updated package outline drawings in **Section 5.1 "Package Marking Information"** to show all views for each package.
4. Minor editorial changes.

Revision G (March 2011)

The following is the list of modifications:

1. Updated the marking information for the 5-Lead SC-70 package in **Section 5.1 "Package Marking Information"**.

Revision F (September 2007)

1. Corrected polarity of MCP6541U SOT-23-5 pin out diagram on front page.
2. **Section 5.0 "Packaging Information"**: Updated package outline drawings per MarCom.

Revision E (September 2006)

The following is the list of modifications:

1. Added MCP6541U pinout for the SOT-23-5 package.
2. Clarified Absolute Maximum Analog Input Voltage and Current Specifications.
3. Added applications write-ups on unused comparators.
4. Added disclaimer to package outline drawings.

Revision D (May 2006)

The following is the list of modifications:

1. Added E-temp parts.
2. Changed V_{HYST} temperature specification to linear and quadratic temperature coefficients.
3. Changed specifications and plots for E-Temp.
4. Added section **3.0 "Pin Descriptions"**.
5. Corrected package marking (See **Section 5.1 "Package Marking Information"**).
6. Added **Appendix A: "Revision History"**.

Revision C (September 2003)

- Undocumented changes.

Revision B (November 2002)

- Undocumented changes.

Revision A (March 2002)

- Original Release of this Document.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
