Ordering Information

Part Number	Configuration	Package	Junction Temp. Range ⁽¹⁾	Lead Finish
MIC4126YME	Dual Inverting	EPAD 8-lead SOIC	–40° to +125°C	Pb-Free
MIC4126YMME	Dual Inverting	EPAD 8-lead MSOP	–40° to +125°C	Pb-Free
MIC4126YML	Dual Inverting	8-lead MLF	–40° to +125°C	Pb-Free
MIC4127YME	Dual Non-inverting	EPAD 8-lead SOIC	–40° to +125°C	Pb-Free
MIC4127YMME	Dual Non-inverting	EPAD 8-lead MSOP	–40° to +125°C	Pb-Free
MIC4127YML	Dual Non-inverting	8-lead MLF	–40° to +125°C	Pb-Free
MIC4128YME	Inverting + Non-inverting	EPAD 8-lead SOIC	–40° to +125°C	Pb-Free
MIC4128YMME	Inverting + Non-inverting	EPAD 8-lead MSOP	–40° to +125°C	Pb-Free
MIC4128YML	Inverting + Non-inverting	8-lead MLF	–40° to +125°C	Pb-Free

Pin Configuration

Pin Description

Pin Number	Pin Name	Pin Function
1, 8	NC	Not internally connected
2	INA	Control Input A: TTL/CMOS compatible logic input
3	GND	Ground
4	INB	Control Input B: TTL/CMOS compatible logic input.
5	OUTB	Output B: CMOS totem-pole output.
6	V _S	Supply Input: +4.5V to +20V
7	OUTA	Output A: CMOS totem-pole output.
EP	GND	Ground, backside pad.

Absolute Maximum Ratings⁽¹⁾

Supply Voltage (V _S)	+24V
Input Voltage (V _{IN})	V_{S} + 0.3V to GND – 5V
Junction Temperature (T _J)	150°C
Storage Temperature	–65°C to +150°C
Lead Temperature (10 sec.)	
ESD Rating, Note 3	

Operating Ratings⁽²⁾

Supply Voltage (V _S)	+4.5V to +20V
Temperature Range (T _J)	40°C to +125°C
Package Thermal Resistance	
3X3 MLF™ θ _{JA}	60°C/W
EPAD MSOP-8L θ_{JA}	60°C/W
EPAD SOIC-8L θ_{JA}	58°C/W

Electrical Characteristics (4)

 $4.5V \le V_S \le 20V$; Input voltage slew rate >1V/µs; C_{OUT} = 1000pF. T_A = 25°C, **bold** values indicate full specified temperature range; unless noted.

Symbol	Parameter	Condition	Min	Тур	Max	Units
Input						
V _{IH}	Logic 1 Input Voltage		2.4 2.4	1.4 1.6		V
VIL	Logic 0 Input Voltage			1.1 1.3	0.8 0.8	V
l _{in}	Input Current	$0 \le V_{IN} \le V_S$	-1		1	μA
Output						
V _{OH}	High Output Voltage		V _S -0.025			V
V _{OL}	Low Output Voltage				0.025	V
R ₀	Output Resistance	I _{OUT} = 10mA, V _S = 20V		6 8	10 12	Ω
I _{PK}	Peak Output Current			1.5		А
I	Latch-Up Protection	Withstand reverse current	>200			mA
Switching Time						
t _R	Rise Time	Test Figure 1		13 20	30 40	ns
t _F	Fall Time	Test Figure 1		15 18	25 40	ns
t _{D1}	Delay Time	Test Figure 1		37 43	50 60	ns
t _{D2}	Delay Time	Test Figure 1		40 45	60 70	ns
Power Sup	Power Supply					
I _S	Power Supply Current	$V_{INA} = V_{INB} = 3.0V$		1.4 1.5	4.5 8	mA
I _S	Power Supply Current	$V_{INA} = V_{INB} = 0.0V$		0.18 0.19	0.4 0.6	mA

Notes:

2. The device is not guaranteed to function outside its operating rating.

3. Devices are ESD sensitive. Handling precautions recommended. Human body model: $1.5k\Omega$ in series with 100pF.

4. Specification for packaged product only.

July 2005

^{1.} Exceeding the absolute maximum rating may damage the device.

Application Information

Supply Bypassing

Large currents are required to charge and discharge large capacitive loads quickly. For example, changing a 1000pF load by 16V in 25ns requires 0.8A from the supply input.

To guarantee low supply impedance over a wide frequency range, parallel capacitors are recommended for power supply bypassing. Low-inductance ceramic MLC capacitors with short lead lengths (< 0.5") should be used. A 1.0μ F film capacitor in parallel with one or two 0.1μ F ceramic MLC capacitors normally provides adequate bypassing.

Grounding

When using the inverting drivers in the MIC4126 or MIC4128, individual ground returns for the input and output circuits or a ground plane are recommended for optimum switching speed. The voltage drop that occurs between the driver's ground and the input signal ground, during normal high-current switching, will behave as negative feedback and degrade switching speed.

The E-pad and MLF packages have an exposed pad under the package. It's important for good thermal performance that this pad is connected to a ground plane.

Control Input

Unused driver inputs must be connected to logic high (which can be V_S) or ground. For the lowest quiescent current (< 500µA), connect unused inputs-to-ground. A logic-high signal will cause the driver to draw up to 9mA.

The control input voltage threshold is approximately 1.5V. The control input recognizes 1.5V up to V_S as a logic high and draws less than 1µA within this range.

Power Dissipation

Power dissipation should be calculated to make sure that the driver is not operated beyond its thermal ratings. Quiescent power dissipation is negligible. A practical value for total power dissipation is the sum of the dissipation caused by the load and the transition power dissipation (P_L + P_T).

Load Dissipation

Power dissipation caused by continuous load current (when driving a resistive load) through the driver's output resistance is:

 $P_L = I_L^2 R_O$

For capacitive loads, the dissipation in the driver is:

$$P_{L} = f C_{L} V_{S}^{2}$$

Transition Dissipation

In applications switching at a high frequency, transition power dissipation can be significant. This occurs during switching transitions when the P-channel and N-channel output FETs are both conducting for the brief moment when one is turning on and the other is turning off.

$$P_T = 2 f V_S Q$$

Charge (Q) is read from the following graph:

Crossover Energy Loss per Transition
