Note:

Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

- 1. "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.
- 2. Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground unless otherwise specified.
- 3. All typicals are given for: $V_{CC} = +3.3V$, $T_A = +25$ °C.
- 4. Generator waveform for all tests unless otherwise specified: f = 1 MHz, $Z_O = 50\Omega$, t_R and t_F (0% to 100%) \leq 3ns for R_{IN} .
- 5. The VCMR range is reduced for larger V_{ID} . Example : if $V_{ID} = 400 \text{mV}$, the VCMR is 0.2V to 2.2V. The fail-safe condition with inputs shorted is valid over a common-mode range of 0V to 2.3V. A V_{ID} up tp V_{CC} 0V may be applied to the R_{IN+} / R_{IN-} inputs with the Common-Mode voltage set to V_{CC} /2. Propagation delay and Differential Pulse skew decrease when VID is increased from 200mV to 400 mV. Skew specifications apply for $200 \text{mV} \le V_{ID} \le 800 \text{mV}$ over the common mode range.
- tskd1 is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.
- 7. t_{SKD2}, Channel-to-Channel Skew, is defined as the difference between the propagation delay of one channel and that of the others on the same chip with any event on the inputs.
- 8. t_{SKD3}, Part-to-Part Skew, is the differential Channel-to-Channel skew of any event between devices. This specification applies to devices at the same V_{CC}, and within 5°C of each other within the operating temperature range.
- t_{SKD4}, Part-to-Part Skew, is the differential Channel-to-Channel skew of any event between devices. This specification applies
 to devices over recommended operating temperature and voltage ranges, and across process distribution. tskd4 is defined as IMax Mini
 differential propagation delay.
- 10. Output short circuit current (I_{OS}) is specified as magnitude only, minus sign indicates direction only. Only one output should be shorted at a time, do not exceed maximum junction temperature specification.
- 11. C_L includes probe and jig capacitance.
- 12. V_{CC} is always higher than R_{IN+} and R_{IN-} voltage. R_{IN-} and R_{IN+} are allowed to have a voltage range -0.2V to V_{CC} $V_{ID}/2$. However, to be compliant with AC specifications, the common voltage range 0.1V to 2.3V.
- 13. fmax generator input conditions: $t_R = t_F < 1$ ns, (0% to 100%), 50% duty cycle, differential (1.05V to1.35V peak to peak). Output Criteria: duty cycle = 60%/40%, V_{OL} (max 0.4V), V_{OH} (min 2.7V), Load = 10pF (stray plus probes).
