\*1: Refer to the Dropout Voltage parameter.

\*2: I<sub>S1</sub> is specified at the 5% drop point of output voltage V<sub>O</sub> under the condition of Output Voltage parameter.

\*3: Output is OFF when the output control terminal (V<sub>C</sub> terminal) is open. Each input level is equivalent to LS-TTL level. Therefore, the device can be driven directly by LS-TTLs.

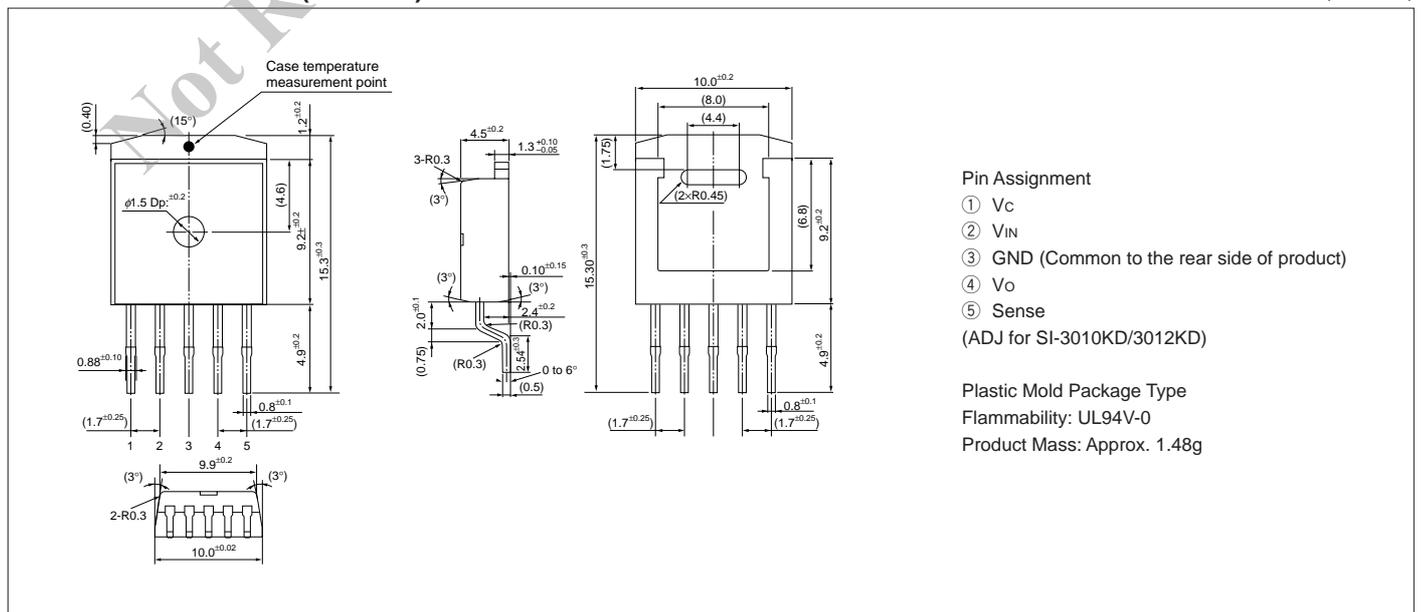

\*4: SI-3010KD, SI-3050KD, cannot be used in the following applications because the built-in foldback-type overcurrent protection may cause errors during start-up stage.

(1) Constant current load (2) Positive and negative power supply (3) Series-connected power supply (4) V<sub>O</sub> adjustment by raising ground voltage

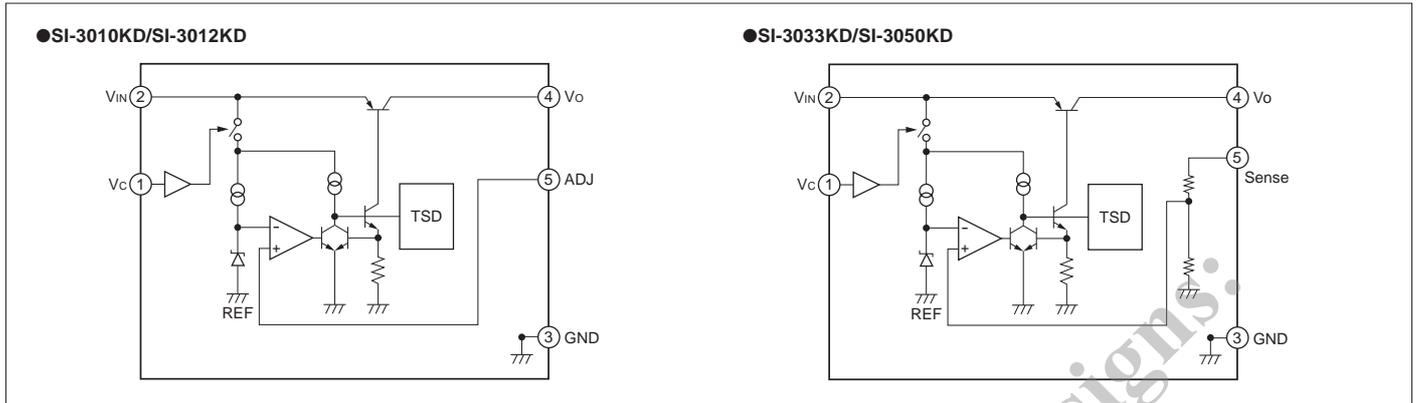

\*5: V<sub>IN</sub> (max) and I<sub>O</sub> (max) are restricted by the relation P<sub>b</sub> = (V<sub>IN</sub> - V<sub>O</sub>) X I<sub>O</sub>. Please calculate these values referring to the Copper laminate area vs. Power dissipation data as shown hereinafter.
