Pin Description

| Pin Number	Function	Description	Interface Schematic
1	Vcc	+5V Voltage Supply	
2	RFINP	RF Positive Input. Input is DC coupled, external DC blocks required..	
3	RFINN	RF Negative Input. Input is DC coupled, external DC blocks required...	
4	GND	this pin must be connected to RF/DC ground.	
5	B0	Division ratio (LSB) See programming truth table.	
6	B1	Division ratio (MSB) See programming truth table.	
7	CTRL	Divider Output Buffer Power Control	
13	BIAS1	For proper operation this pin should be grounded.	
14	BIAS0	Digital Core Bias Control [1]	
15	EN	Chip Enable	
8, 9, 12	N/C	No connection required. This pin may be connected to ground, without affecting performance.

Pin Description (Continued)

Pin Number	Function	Description	Interface Schematic
10	IOUTN	Divider Negative Output, Open Drain. Typically 100 Ohms connected to Vcc.	
11	IOUTP	Divider Positive Output, Open Drain. Typically 100 Ohms connected to Vcc.	
16	CBIAS	External Bypass Decoupling for Precision/Low Noise Bias Circuit	

Application Note:

The HMC794LP3E is a high performance RF divider. Such dividers are high gain devices with internal feedback. The device will oscillate if used with AC coupled RF inputs and if no RF input is applied. Normally, if the RF input signal is removed the device should be disabled, or it should be placed in divide by 1 mode. The device is stable in divide by one mode with no RF input. The device will oscillate in divide 2, 3, or 4 modes with no RF input. In general very small RF input levels will stop all oscillations. At the minimum rated RF input sensitivity level or higher, no oscillations or spurious signals exist and excellent low noise performance is achieved.

For input frequency lower than 200 MHz, square wave input signal is recommended.

The divider output power for the differential mode, shows a roll off at lower frequencies due to the limited frequency range of the T6 & T7 (4:1) RF transformers, 500 MHz to 3000 MHz.

[1] Reference this number when ordering complete evaluation PCB

[2] Circuit Board Material: Rogers 4350 or Arlon 25FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and backside ground paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.

Evaluation PCB Schematic

[1] For single ended operation perform the following modifications to this assembly:
1) Remove T6 and T7, C4 and C6
2) Install 0Ω resistors (jumpers) over the following pads:
 a) Pads 1 and 2 on T6 location
 b) Pads 5 and 6 on T6 location
 c) Pads 2 and 3 on T7 location
 d) Pads 4 and 6 on T7 location
3) Install 100pF cap in location C99
4) Install jumper wire at location Pad 1 on T7 to Ground. Remove solder
 mask to reveal ground plane in this area.
