T_{stg}	Storage temperature range	-65 to +150	°C
T_j	Junction temperature	+150	°C

1. Maximum power supply voltage when the comparator is not switching.
2. All voltage values, except differential voltage, are with respect to network ground terminal.
3. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
4. The magnitude of the input and the output voltages must never exceed the magnitude of the positive supply voltage.
5. Guaranteed by design.
6. Short-circuit from outputs to Vcc+ can cause excessive heating and eventual destruction.
7. Pd is calculated with T_{amb} = +25°C, T_j = +150°C and R_{thja} = 100°C/W for DIP8 package = 175°C/W for SO-8 package.

I_{CC}	Supply current (each comparator) (V_{id} = 1 V, no load)		150	375	µA

1. The specified offset voltage is the maximum value required to drive the output down to 400 mV or up to 4 V with R_L = 100 kΩ to V_{cc}+
2. Maximum values including unavoidable inaccuracies of the industrial test.

Table 4. Switching characteristics (V_{CC}+ = 5 V, Tamb = 25°C)

Symbol	Parameter	Min.	Typ.	Max.	Unit
t_{re}	Response time (R_L = 5.1 kΩ connected to 5 V, C_L = 15 pF (1) 100mV input step with 5mV overdrive TTL level input step		600 200		ns

1. The specified response time is the internal between the input signal and the instant when the output signal crosses 1.4 V.

Note: If one of the two channels is not used, it must be configured with a differential input voltage greater than 100 mV to avoid switching.
