Power-Down Mode	Full	2.5			2.5			mW

<sup>1</sup> See the [AN-835](#) Application Note, *Understanding High Speed ADC Testing and Evaluation*, for a complete set of definitions and how these tests were completed.

<sup>2</sup> The input range is programmable through the SPI, and the range specified reflects the nominal values of each setting. See the Memory Map section.

<sup>3</sup> I<sub>AVDD</sub> and I<sub>DRVDD</sub> are measured with a -1 dBFS, 30.3 MHz sine input at rated sample rate.

<sup>4</sup> Single data rate mode; this is the default mode of the AD9434.

<sup>5</sup> Double data rate mode; user-programmable feature. See the Memory Map section.

## AC SPECIFICATIONS

AVDD = 1.8 V, DRVDD = 1.8 V, T<sub>MIN</sub> = -40°C, T<sub>MAX</sub> = +85°C, f<sub>IN</sub> = -1.0 dBFS, full scale = 1.5 V, unless otherwise noted.

Table 2.

Parameter <sup>1, 2</sup>	Temp	AD9434-370			AD9434-500			Unit
		Min	Typ	Max	Min	Typ	Max	
SNR								
f <sub>IN</sub> = 30.3 MHz	25°C		66.3			65.9		dBFS
f <sub>IN</sub> = 70.3 MHz	25°C		66.2			65.9		dBFS
f <sub>IN</sub> = 100.3 MHz	25°C		66.1			65.8		dBFS
	Full	65.3			64.5			dBFS
f <sub>IN</sub> = 250.3 MHz	25°C		65.5			65.2		dBFS
f <sub>IN</sub> = 450.3 MHz	25°C		64.0			63.5		dBFS
SINAD								
f <sub>IN</sub> = 30.3 MHz	25°C		66.1			65.9		dBFS
f <sub>IN</sub> = 70.3 MHz	25°C		66.1			65.8		dBFS
f <sub>IN</sub> = 100.3 MHz	25°C		66.0			65.8		dBFS
	Full	65.2			64.4			dBFS
f <sub>IN</sub> = 250.3 MHz	25°C		65.3			64.8		dBFS
f <sub>IN</sub> = 450.3 MHz	25°C		63.7			62.9		dBFS
EFFECTIVE NUMBER OF BITS (ENOB)								
f <sub>IN</sub> = 30.3 MHz	25°C		10.7			10.7		Bits
f <sub>IN</sub> = 70.3 MHz	25°C		10.7			10.6		Bits
f <sub>IN</sub> = 100.3 MHz	25°C		10.7			10.6		Bits
f <sub>IN</sub> = 250.3 MHz	25°C		10.6			10.5		Bits
f <sub>IN</sub> = 450.3 MHz	25°C		10.3			10.2		Bits
WORST HARMONIC (SECOND or THIRD)								
f <sub>IN</sub> = 30.3 MHz	25°C		-93			-93		dBc
f <sub>IN</sub> = 70.3 MHz	25°C		-89			-91		dBc
f <sub>IN</sub> = 100.3 MHz	25°C		-83			-87		dBc
	Full			-75			-74	dBc
f <sub>IN</sub> = 250.3 MHz	25°C		-80			-78		dBc
f <sub>IN</sub> = 450.3 MHz	25°C		-78			-69		dBc
SFDR								
f <sub>IN</sub> = 30.3 MHz	25°C		89			84		dBc
f <sub>IN</sub> = 70.3 MHz	25°C		88			82		dBc
f <sub>IN</sub> = 100.3 MHz	25°C		83			83		dBc
	Full	75			74			dBc
f <sub>IN</sub> = 250.3 MHz	25°C		79			78		dBc
f <sub>IN</sub> = 450.3 MHz	25°C		78			68		dBc
WORST OTHER HARMONIC (SFDR EXCLUDING SECOND and THIRD)								
f <sub>IN</sub> = 30.3 MHz	25°C		-90			-85		dBc
f <sub>IN</sub> = 70.3 MHz	25°C		-90			-82		dBc
f <sub>IN</sub> = 100.3 MHz	25°C		-91			-84		dBc
	Full			-75			-74	dBc
f <sub>IN</sub> = 250.3 MHz	25°C		-83			-85		dBc
f <sub>IN</sub> = 450.3 MHz	25°C		-82			-78		dBc
TWO-TONE IMD								
f <sub>IN1</sub> = 119.5 MHz, f <sub>IN2</sub> = 122.5 MHz	25°C		-85			-85		dBc
ANALOG INPUT BANDWIDTH								
Full Power	25°C		1			1		GHz

<sup>1</sup> All ac specifications tested by driving CLK+ and CLK- differentially.

<sup>2</sup> See the [AN-835](#) Application Note, *Understanding High Speed ADC Testing and Evaluation*, for a complete set of definitions and how these tests were completed.

## DIGITAL SPECIFICATIONS

AVDD = 1.8 V, DRVDD = 1.8 V, T<sub>MIN</sub> = -40°C, T<sub>MAX</sub> = +85°C, f<sub>IN</sub> = -1.0 dBFS, full scale = 1.5 V, unless otherwise noted.

## ABSOLUTE MAXIMUM RATINGS

Table 5.

Parameter	Rating
Electrical	
AVDD to AGND	−0.3 V to +2.0 V
DRVDD to DRGND	−0.3 V to +2.0 V
AGND to DRGND	−0.3 V to +0.3 V
AVDD to DRVDD	−2.0 V to +2.0 V
D0+/D0− Through D11+/D11− to DRGND	−0.3 V to DRVDD + 0.2 V
DCO+, DCO− to DRGND	−0.3 V to DRVDD + 0.2 V
OR+, OR− to DRGND	−0.3 V to DRVDD + 0.2 V
CLK+ to AGND	−0.3 V to AVDD + 0.2 V
CLK− to AGND	−0.3 V to AVDD + 0.2 V
VIN+ to AGND	−0.3 V to AVDD + 0.4 V
VIN− to AGND	−0.3 V to AVDD + 0.4 V
CML to AGND	−0.3 V to AVDD + 0.2 V
VREF to AGND	−0.3 V to AVDD + 0.2 V
SDIO to DRGND	−0.3 V to DRVDD + 0.2 V
PDWN to AGND	−0.3 V to DRVDD + 0.2 V
CSB to AGND	−0.3 V to DRVDD + 0.2 V
SCLK/DFS to AGND	−0.3 V to DRVDD + 0.2 V
Environmental	
Storage Temperature Range	−65°C to +125°C
Operating Temperature Range	−40°C to +85°C
Lead Temperature (Soldering, 10 sec)	300°C
Junction Temperature	150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### THERMAL RESISTANCE

The exposed paddle must be soldered to the ground plane for the LFCSP package. Soldering the exposed paddle to the PCB increases the reliability of the solder joints, maximizing the thermal capability of the package.

Table 6.

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
56-Lead LFCSP_VQ (CP-56-5)	23.7	1.7	°C/W

Typical  $\theta_{JA}$  and  $\theta_{JC}$  are specified for a 4-layer board in still air. Airflow increases heat dissipation, effectively reducing  $\theta_{JA}$ . In addition, metal in direct contact with the package leads from metal traces, through holes, ground, and power planes reduces the  $\theta_{JA}$ .

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

**NOTES**

1. DNC = DO NOT CONNECT. DO NOT CONNECT TO THIS PIN.
2. AGND AND DRGND SHOULD BE TIED TO A COMMON QUIET GROUND PLANE.
3. THE EXPOSED PADDLE MUST BE SOLDERED TO A GROUND PLANE.

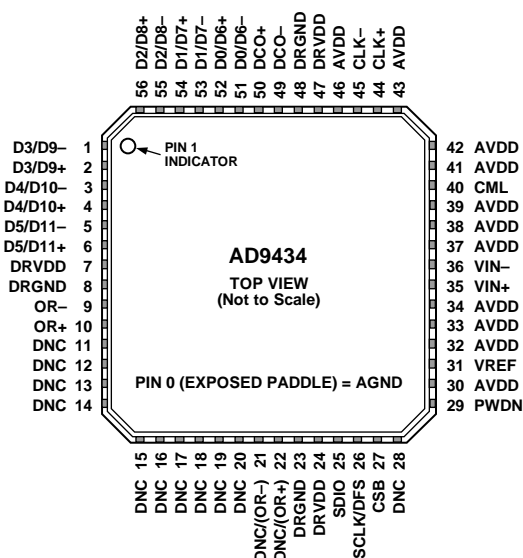

*Figure 4. Pin Configuration—Single Data Rate Mode*

Pin No.	Mnemonic	Description
0	AGND <sup>1</sup>	Analog Ground. The exposed paddle must be soldered to a ground plane.
30, 32 to 34, 37 to 39, 41 to 43, 46	AVDD	1.8 V Analog Supply.
7, 24, 47	DRVDD	1.8 V Digital Output Supply.
8, 23, 48	DRGND <sup>1</sup>	Digital Output Ground.
35	VIN+	Analog Input—True.
36	VIN–	Analog Input—Complement.
40	CML	Common-Mode Output. Enabled through the SPI, this pin provides a reference for the optimized internal bias voltage for VIN+/VIN–.
44	CLK+	Clock Input—True.
45	CLK–	Clock Input—Complement.
31	VREF	Voltage Reference Internal/Input/Output. Nominally 0.75 V.
28	DNC	Do Not Connect. Do not connect to this pin. This pin should be left floating.
25	SDIO	Serial Port Interface (SPI) Data Input/Output (Serial Port Mode).
26	SCLK/DFS	Serial Port Interface Clock (Serial Port Mode)/Data Format Select (External Pin Mode).
27	CSB	Serial Port Chip Select (Active Low).
29	PWDN	Chip Power-Down.
49	DCO–	Data Clock Output—Complement.
50	DCO+	Data Clock Output—True.
51	D0–	D0 Complement Output (LSB).
52	D0+	D0 True Output (LSB).
53	D1–	D1 Complement Output.
54	D1+	D1 True Output.
55	D2–	D2 Complement Output.
56	D2+	D2 True Output.
1	D3–	D3 Complement Output.
2	D3+	D3 True Output.
3	D4–	D4 Complement Output.

Pin No.	Mnemonic	Description
4	D4+	D4 True Output.
5	D5–	D5 Complement Output.
6	D5+	D5 True Output.
9	D6–	D6 Complement Output.
10	D6+	D6 True Output.
11	D7–	D7 Complement Output.
12	D7+	D7 True Output.
13	D8–	D8 Complement Output.
14	D8+	D8 True Output.
15	D9–	D9 Complement Output.
16	D9+	D9 True Output.
17	D10–	D10 Complement Output.
18	D10+	D10 True Output.
19	D11–	D11 Complement Output (MSB).
20	D11+	D11 True Output (MSB).
21	OR–	Overrange Complement Output.
22	OR+	Overrange True Output.

<sup>1</sup> AGND and DRGND should be tied to a common quiet ground plane.

## NOTES

1. DNC = DO NOT CONNECT. DO NOT CONNECT TO THIS PIN.
2. AGND AND DRGND SHOULD BE TIED TO A COMMON QUIET GROUND PLANE.
3. THE EXPOSED PADDLE MUST BE SOLDERED TO A GROUND PLANE.

55	D2/D8–	D2/D8 Complement Output.
56	D2/D8+	D2/D8 True Output.
1	D3/D9–	D3/D9 Complement Output.
2	D3/D9+	D3/D9 True Output.
3	D4/D10–	D4/D10 Complement Output.
4	D4/D10+	D4/D10 True Output.
5	D5/D11–	D5/D11 Complement Output (MSB).

Pin No.	Mnemonic	Description
6	D5/D11+	D5/D11 True Output (MSB).
9	OR–	Overrange Complement Output. (This pin is disabled if Pin 21 is reconfigured through the SPI to be OR–.)
10	OR+	Overrange True Output. (This pin is disabled if Pin 22 is reconfigured through the SPI to be OR+.)
11 to 20, 28	DNC	Do Not Connect. Do not connect to these pins. These pins should be left floating.
21	DNC/(OR–)	Do Not Connect. Do not connect to this pin. (This pin can be reconfigured as the overrange complement output through the serial port register.)
22	DNC/(OR+)	Do Not Connect. Do not connect to this pin. (This pin can be reconfigured as the overrange true output through the serial port register.)

<sup>1</sup> Tie AGND and DRGND to a common quiet ground plane.

## TYPICAL PERFORMANCE CHARACTERISTICS

AVDD = 1.8 V, DRVDD = 1.8 V, rated sample rate,  $T_A = 25^\circ\text{C}$ , 1.5 V p-p differential input, AIN = -1 dBFS, unless otherwise noted.

## THEORY OF OPERATION

The AD9434 architecture consists of a front-end sample-and-hold amplifier (SHA) followed by a pipelined switched capacitor ADC. The quantized outputs from each stage are combined into a final 12-bit result in the digital correction logic. The pipelined architecture permits the first stage to operate on a new input sample, whereas the remaining stages operate on preceding samples. Sampling occurs on the rising edge of the clock.

Each stage of the pipeline, excluding the last, consists of a low resolution flash ADC connected to a switched capacitor DAC and interstage residue amplifier (MDAC). The residue amplifier magnifies the difference between the reconstructed DAC output and the flash input for the next stage in the pipeline. One bit of redundancy is used in each stage to facilitate digital correction of flash errors. The last stage simply consists of a flash ADC.

The input stage contains a differential SHA that can be ac- or dc-coupled in differential or single-ended mode. The output staging block aligns the data, carries out the error correction, and passes the data to the output buffers. The output buffers are powered from a separate supply, allowing adjustment of the output voltage swing. During power-down, the output buffers enter a high impedance state.

### ANALOG INPUT AND VOLTAGE REFERENCE

The analog input to the AD9434 is a differential buffer. For best dynamic performance, match the source impedances driving VIN+ and VIN– such that common-mode settling errors are symmetrical. The analog input is optimized to provide superior wideband performance and requires that the analog inputs be driven differentially. SNR and SINAD performance degrades significantly if the analog input is driven with a single-ended signal.

A wideband transformer, such as Mini-Circuits® ADT1-1WT, can provide the differential analog inputs for applications that require a single-ended-to-differential conversion. Both analog inputs are self-biased by an on-chip reference to a nominal 1.7 V.

An internal differential voltage reference creates positive and negative reference voltages that define the 1.5 V p-p fixed span of the ADC core. This internal voltage reference can be adjusted by means of an SPI control. See the AD9434 Configuration Using the SPI section for more details.

### Differential Input Configurations

Optimum performance is achieved while driving the AD9434 in a differential input configuration. For baseband applications, the AD8138 differential driver provides excellent performance and a flexible interface to the ADC. The output common-mode voltage of the AD8138 is easily set to  $AVDD/2 + 0.5$  V, and the driver can be configured in a Sallen-Key filter topology to provide band limiting of the input signal.

Figure 41. Differential Input Configuration Using the AD8138

At input frequencies in the second Nyquist zone and above, the performance of most amplifiers may not be adequate to achieve the true performance of the AD9434. This is especially true in IF undersampling applications where frequencies in the 70 MHz to 100 MHz range are being sampled. For these applications, differential transformer coupling is the recommended input configuration. The signal characteristics must be considered when selecting a transformer. Most RF transformers saturate at frequencies below a few megahertz (MHz), and excessive signal power can cause core saturation, which leads to distortion.

In any configuration, the value of the shunt capacitor, C (see Figure 43), is dependent on the input frequency and may need to be reduced or removed.

Figure 42. Differential Transformer—Coupled Configuration

As an alternative to using a transformer-coupled input at frequencies in the second Nyquist zone, the AD8352 differential driver can be used (see Figure 43).

Figure 43. Differential Input Configuration Using the AD8352

## CLOCK INPUT CONSIDERATIONS

For optimum performance, drive the AD9434 sample clock inputs (CLK+ and CLK-) with a differential signal. This signal is typically ac-coupled into the CLK+ and CLK- pins via a transformer or capacitors. These pins are biased at ~0.9 V internally and require no additional bias. If the clock signal is dc-coupled, then the common-mode voltage should remain within a range of 0.9 V.

Figure 44 shows one preferred method for clocking the AD9434. The low jitter clock source is converted from single-ended to differential using an RF transformer. The back-to-back Schottky diodes across the secondary transformer limit clock excursions into the AD9434 to approximately 0.8 V p-p differential. This helps prevent the large voltage swings of the clock from feeding through to other portions of the AD9434 and preserves the fast rise and fall times of the signal, which are critical to low jitter performance.

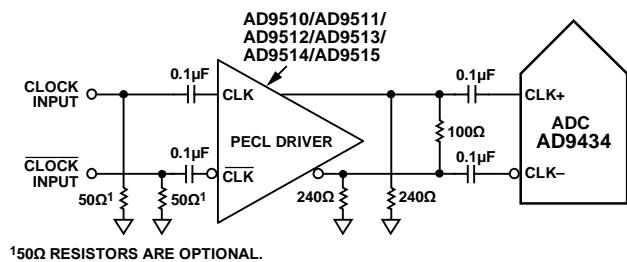

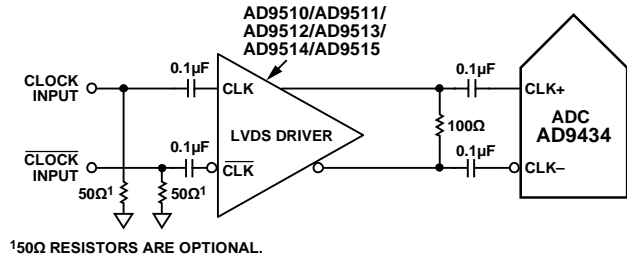

Figure 44. Transformer-Coupled Differential Clock

If a low jitter clock is available, another option is to ac couple a differential PECL signal to the sample clock input pins, as shown in Figure 45. The AD9510/AD9511/AD9512/AD9513/AD9514/AD9515 family of clock drivers offers excellent jitter performance.

150Ω RESISTORS ARE OPTIONAL.

Figure 45. Differential PECL Sample Clock

150Ω RESISTORS ARE OPTIONAL.

Figure 46. Differential LVDS Sample Clock

In some applications, it may be acceptable to drive the sample clock inputs with a single-ended 1.8 V CMOS signal. In such applications, drive the CLK+ pin directly from a CMOS gate, and bypass the CLK- pin to ground with a 0.1 µF capacitor in parallel with a 39 kΩ resistor (see Figure 47).

150Ω RESISTOR IS OPTIONAL.

Figure 47. Single-Ended 1.8 V CMOS Input Clock (Up to 200 MHz)

### Clock Duty Cycle Considerations

Typical high speed ADCs use both clock edges to generate a variety of internal timing signals. As a result, these ADCs may be sensitive to clock duty cycle. A 5% tolerance is commonly required on the clock duty cycle to maintain dynamic performance characteristics. The AD9434 contains a duty cycle stabilizer (DCS) that retimes the nonsampling edge, providing an internal clock signal with a nominal 50% duty cycle. This allows a wide range of clock input duty cycles without affecting the performance of the AD9434.

The duty cycle stabilizer uses a delay-locked loop (DLL) to create the nonsampling edge. As a result, any changes to the sampling frequency require approximately 5  $\mu$ s to allow the DLL to acquire and lock to the new rate.

### Clock Jitter Considerations

High speed, high resolution ADCs are sensitive to the quality of the clock input. The degradation in SNR at a given input frequency ( $f_A$ ) due only to aperture jitter ( $t_j$ ) can be calculated by

$$\text{SNR Degradation} = 20 \times \log_{10}(1/2 \times \pi \times f_A \times t_j)$$

In this equation, the rms aperture jitter represents the root mean square of all jitter sources, including the clock input, analog input signal, and ADC aperture jitter specifications. IF undersampling applications are particularly sensitive to jitter (see Figure 48).

Treat the clock input as an analog signal in cases where aperture jitter may affect the dynamic range of the AD9434. Separate power supplies for clock drivers from the ADC output driver supplies to avoid modulating the clock signal with digital noise. Low jitter, crystal-controlled oscillators make the best clock sources. If the clock is generated from another type of source (by gating, dividing, or other methods), it should be retimed by the original clock at the last step.

Refer to the AN-501 Application Note and the AN-756 Application Note for more in-depth information about jitter performance as it relates to ADCs (visit [www.analog.com](http://www.analog.com)).

Figure 48. Ideal SNR vs. Input Frequency and Jitter

### POWER DISSIPATION AND POWER-DOWN MODE

As shown in Figure 31, the power dissipated by the AD9434 is proportional to its sample rate. The digital power dissipation does not vary much because it is determined primarily by the DRVDD supply and bias current of the LVDS output drivers.

By asserting PDWN (Pin 29) high, the AD9434 is placed in standby mode or full power-down mode, as determined by the contents of Serial Port Register 08. Reasserting the PDWN pin low returns the AD9434 to its normal operational mode.

An additional standby mode is supported by means of varying the clock input. When the clock rate falls below 50 MHz, the AD9434 assumes a standby state. In this case, the biasing network and internal reference remain on, but digital circuitry is powered down. Upon reactivating the clock, the AD9434 resumes normal operation after allowing for the pipeline latency.

### DIGITAL OUTPUTS

#### Digital Outputs and Timing

The AD9434 differential outputs conform to the ANSI-644 LVDS standard on default power-up. This can be changed to a low power, reduced signal option similar to the IEEE 1596.3 standard using the SPI. This LVDS standard can further reduce the overall power dissipation of the device, which reduces the power by ~39 mW. See the Memory Map section for more information. The LVDS driver current is derived on chip and sets the output current at each output equal to a nominal 3.5 mA. A 100  $\Omega$  differential termination resistor placed at the LVDS receiver inputs results in a nominal 350 mV swing at the receiver.

The AD9434 LVDS outputs facilitate interfacing with LVDS receivers in custom ASICs and FPGAs that have LVDS capability for superior switching performance in noisy environments. Single point-to-point net topologies are recommended with a 100  $\Omega$  termination resistor placed as close to the receiver as possible. No far end receiver termination or poor differential trace routing may result in timing errors. It is recommended that the trace length be no longer than 24 inches and that the differential output traces be kept close together and at equal lengths.

An example of the LVDS output using the ANSI standard (default) data eye and a time interval error (TIE) jitter histogram with trace lengths less than 24 inches on regular FR-4 material is shown in Figure 49. Figure 50 shows an example of when the trace lengths exceed 24 inches on regular FR-4 material. Notice that the TIE jitter histogram reflects the decrease of the data eye opening as the edge deviates from the ideal position. It is up to the user to determine if the waveforms meet the timing budget of the design when the trace lengths exceed 24 inches.

Figure 49. Data Eye for LVDS Outputs in ANSI Mode with Trace Lengths Less than 24 Inches on Standard FR-4, AD9434-500

Figure 50. Data Eye for LVDS Outputs in ANSI Mode with Trace Lengths Greater than 24 Inches on Standard FR-4, AD9434-500

The format of the output data is offset binary by default. An example of the output coding format can be found in Table 12. If it is desired to change the output data format to twos complement, see the AD9434 Configuration Using the SPI section.

An output clock signal is provided to assist in capturing data from the AD9434. The DCO is used to clock the output data and is equal to the sampling clock (CLK) rate. In single data rate mode (SDR), data is clocked out of the AD9434 and must be captured on the rising edge of the DCO. In double data rate mode (DDR), data is clocked out of the AD9434 and must be captured on the rising and falling edges of the DCO. See the timing diagrams shown in Figure 2 and Figure 3 for more information.

#### Output Data Rate and Pinout Configuration

The output data of the AD9434 can be configured to drive 12 pairs of LVDS outputs at the same rate as the input clock signal (SDR mode), or six pairs of LVDS outputs at 2× the rate of the input clock signal (DDR mode). SDR is the default mode; the device can be reconfigured for DDR by setting Bit 3 in Register 14 (see Table 13).

#### Out-of-Range (OR)

An out-of-range condition exists when the analog input voltage is beyond the input range of the ADC. OR+ and OR− (OR±) are digital outputs that are updated along with the data output corresponding to the particular sampled input voltage. Thus, OR± has the same pipeline latency as the digital data. OR± is low when the analog input voltage is within the analog input range and high when the analog input voltage exceeds the input range, as shown in Figure 51. OR± remains high until the analog input returns to within the input range and another conversion is completed. By logically AND'ing OR± with the MSB and its complement, overrange high or underrange low conditions can be detected.

Figure 51. OR± Relation to Input Voltage and Output Data

#### TIMING

The AD9434 provides latched data outputs with a pipeline delay of seven clock cycles. Data outputs are available one propagation delay ( $t_{PD}$ ) after the rising edge of the clock signal.

Minimize the length of the output data lines and loads placed on them to reduce transients within the AD9434. These transients can degrade the dynamic performance of the converter. The AD9434 also provides a data clock output (DCO) intended for capturing the data in an external register. The data outputs are valid on the rising edge of DCO.

The lowest conversion rate of the AD9434 is 50 MSPS. At clock rates below 1 MSPS, the AD9434 assumes the standby mode.

#### VREF

The AD9434 VREF pin (Pin 31) allows the user to monitor the on-board voltage reference, or provide an external reference (requires configuration through the SPI). The three optional settings are internal  $V_{REF}$  (pin is connected to 20 kΩ to ground), export  $V_{REF}$ , and import  $V_{REF}$ . Do not attach a bypass capacitor to this pin. VREF is internally compensated and additional loading may impact performance.

#### AD9434 CONFIGURATION USING THE SPI

The AD9434 SPI allows the user to configure the converter for specific functions or operations through a structured register space inside the ADC. This gives the user added flexibility to customize device operation depending on the application. Addresses are accessed (programmed or readback) serially in 1-byte words. Each byte can be further divided into fields, which are documented in the Memory Map section.

There are three pins that define the serial port interface (SPI) to this particular ADC. They are the SCLK/DFS, SDIO, and CSB pins. The SCLK/DFS (serial clock) is used to synchronize the read and write data presented to the ADC. The SDIO (serial data input/output) is a dual-purpose pin that allows data to be sent to and read from the internal ADC memory map registers. The CSB is an active low control that enables or disables the read and write cycles (see Table 9).

### USING THE AD9434 TO REPLACE THE AD9230

The AD9434 can be used to replace the AD9230 in many applications. In these designs, the user should consider these important differences:

- Pin 28 is a DNC (do not connect) on the AD9434, and should be left floating. The reset functionality of the AD9230 is not available through an external pin, but is available through the SPI interface.
- Pin 31 is the interface to the AD9434 reference circuit. It can be used to monitor the internal reference or provide an external reference voltage (nominally 0.5 V). If the internal reference is used, then this pin can float. The RBIAS function of the AD9230 is not necessary with the AD9434.
- The input voltage range of the AD9434 is nominally 1.5 V p-p, whereas the AD9230 input range is 1.25 V p-p.

**Table 9. Serial Port Pins**

Mnemonic	Function
SCLK	SCLK (serial clock) is the serial shift clock in. SCLK is used to synchronize serial interface reads and writes.
SDIO	SDIO (serial data input/output) is a dual-purpose pin. The typical role for this pin is an input and output depending on the instruction being sent and the relative position in the timing frame.
CSB	CSB (chip select) is an active low control that gates the read and write cycles.

The falling edge of the CSB, in conjunction with the rising edge of the SCLK, determines the start of the framing. An example of the serial timing and its definitions can be found in Figure 52 and Table 11.

During an instruction phase, a 16-bit instruction is transmitted. Data then follows the instruction phase and is determined by the W0 and W1 bits, which is one or more bytes of data. All

data is composed of 8-bit words. The first bit of each individual byte of serial data indicates whether this is a read or write command. This allows the serial data input/output (SDIO) pin to change direction from an input to an output.

Data can be sent in MSB or in LSB first mode. MSB first is default on power-up and can be changed by changing the configuration register. For more information about this feature and others, see the AN-877 Application Note, *Interfacing to High Speed ADCs via SPI* at [www.analog.com](http://www.analog.com).

### HARDWARE INTERFACE

The pins described in Table 9 comprise the physical interface between the programming device of the user and the serial port of the AD9434. The SCLK pin and the CSB pin function as inputs when using the SPI interface. The SDIO pin is bidirectional, functioning as an input during the write phase and as an output during readback.

This interface is flexible enough to be controlled by either PROMs or PIC® microcontrollers as well. This provides the user with an alternate method to program the ADC other than a SPI controller.

If the user chooses not to use the SPI interface, some pins serve a dual function and are associated with a specific function when strapped externally to AVDD or ground during device power-on. The Configuration Without the SPI section describes the strappable functions supported on the AD9434.

### CONFIGURATION WITHOUT THE SPI

In applications that do not interface to the SPI control registers, the SCLK/DFS pin can alternately serve as a standalone CMOS-compatible control pin. In this mode, connect the CSB pin to AVDD, which disables the serial port interface.

**Table 10. Mode Selection**

Mnemonic	External Voltage	Configuration
SCLK/DFS	AVDD AGND	Twos complement enabled Offset binary enabled

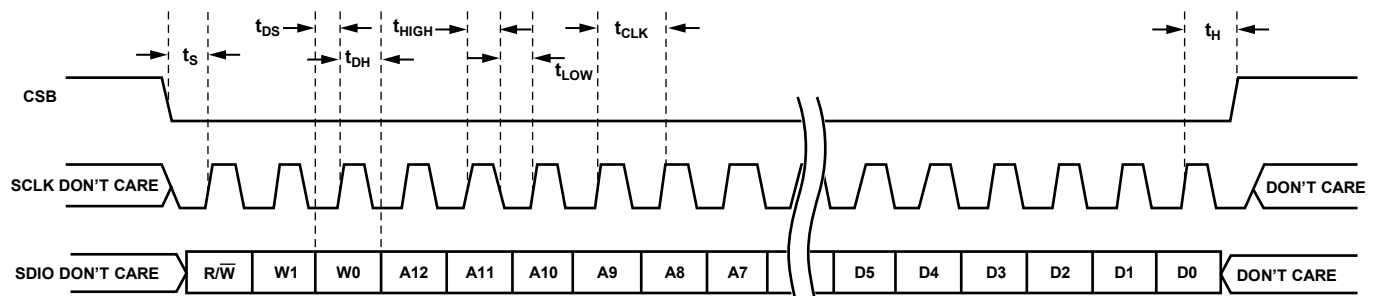

Figure 52. Serial Port Interface Timing Diagram

Table 11. Serial Timing Definitions

Parameter	Min (ns)	Description
$t_{DS}$	5	Setup time between the data and the rising edge of SCLK
$t_{DH}$	2	Hold time between the data and the rising edge of SCLK
$t_{CLK}$	40	Period of the clock
$t_S$	5	Setup time between CSB and SCLK

## MEMORY MAP

### READING THE MEMORY MAP TABLE

Each row in the memory map table (see Table 13) has eight address locations. The memory map is roughly divided into three sections: chip configuration register map (Address 0x00 to Address 0x02), transfer register map (Address 0xFF), and ADC functions register map (Address 0x08 to Address 0x2A). Data written to the ADC functions register addresses also require setting the SW transfer bit in register Address 0xFF to transfer the data from the master to slave registers.

The Addr. (Hex) column of the memory map indicates the register address in hexadecimal, and the Default Value (Hex) column shows the default hexadecimal value that is already written into the register. The Bit 7 (MSB) column is the start of the default hexadecimal value given. For example, Hexadecimal Address 0x2A, OVR\_CONFIG, has a hexadecimal default value of 0x01. This means that Bit 7 = 0, Bit 6 = 0, Bit 5 = 0, Bit 4 = 0, Bit 3 = 0, Bit 2 = 0, Bit 1 = 0, and Bit 0 = 1, or 0000 0001 in binary. The default value enables the OR± output. Overwriting this default so that Bit 0 = 0 disables the OR± output. For more information on this and other functions, consult the [AN-877](#) Application Note, *Interfacing to High-Speed ADCs via SPI®* at [www.analog.com](http://www.analog.com).

### RESERVED LOCATIONS

Undefined memory locations should not be written to other than with the default values suggested in this data sheet. Addresses that have values marked as 0 should be considered reserved and have a 0 written into their registers during power-up.

### DEFAULT VALUES

Exiting out of reset, critical registers are preloaded with default values. These values are indicated in Table 13. Other registers do not have default values and retain the previous value when exiting reset.

### LOGIC LEVELS

An explanation of various registers follows: “Bit is set” is synonymous with “bit is set to Logic 1” or “writing Logic 1 for the bit.” Similarly, “clear a bit” is synonymous with “bit is set to Logic 0” or “writing Logic 0 for the bit.”

**Table 13. Memory Map Register**

Addr. (Hex)	Register Name	Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSB)	Default Value (Hex)	Default Notes/ Comments
Chip Configuration Registers

## OUTLINE DIMENSIONS

COMPLIANT TO JEDEC STANDARDS MO-220-VLLD-2

Figure 53. 56-Lead Lead Frame Chip Scale Package [LFCSP\_VQ]

8 mm × 8 mm Body, Very Thin Quad

(CP-56-5)

Dimensions shown in millimeters

06-11-2012-A

## ORDERING GUIDE

Model <sup>1</sup>	Temperature Range	Package Description	Package Option
AD9434BCPZ-370	−40°C to +85°C	56-Lead Lead Frame Chip Scale Package [LFCSP_VQ]	CP-56-5
AD9434BCPZRL7-370	−40°C to +85°C	56-Lead Lead Frame Chip Scale Package [LFCSP_VQ]	CP-56-5
AD9434BCPZ-500	−40°C to +85°C	56-Lead Lead Frame Chip Scale Package [LFCSP_VQ]	CP-56-5
AD9434BCPZRL7-500	−40°C to +85°C	56-Lead Lead Frame Chip Scale Package [LFCSP_VQ]	CP-56-5
AD9434-370EBZ		LVDS Evaluation Board with AD9434BCPZ-370	
AD9434-500EBZ		LVDS Evaluation Board with AD9434BCPZ-500	

<sup>1</sup> Z = RoHS Compliant Part.
