REVISION HISTORY

5/2018—Rev. A to Rev. B

Changes to General Description Section	1
Changes to Table 2.....	3
Added Note 1, Table 2; Renumbered Sequentially.....	3
Changes to Ordering Guide	9

6/2014—Rev. 0 to Rev. A

Changes to Figure 1 and Figure 2.....	1
---------------------------------------	---

9/2009—Revision 0: Initial Version

SPECIFICATIONS

$T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$, unless otherwise noted. Typical values are at $T_A = 25^{\circ}\text{C}$ and $V_{CC} = 3\text{ V}$. Overtemperature limits are guaranteed by design.

Table 1.

Parameter	Min	Typ	Max	Unit	Test Conditions/Comments
OPERATING VOLTAGE RANGE, V_{CC}	1.0		5.5	V	
INPUT CURRENT, I_{CC}		0.5	1.0	μA	ADM6326/ADM6328 only, $V_{CC} = 3.0\text{ V}$ for $V_{TH} \leq 2.93\text{ V}$, $V_{CC} = 3.2\text{ V}$ for $V_{TH} > 2.93\text{ V}$, no load
		1.0	1.75	μA	$V_{CC} = 5.5\text{ V}$, no load
RESET THRESHOLD					
Threshold Voltage, V_{TH} (See Table 2)	$V_{TH} - 2.5\%$	V_{TH}	$V_{TH} + 2.5\%$	V	$T_A = 25^{\circ}\text{C}$
	$V_{TH} - 1.5\%$	V_{TH}	$V_{TH} + 1.5\%$	V	
Temperature Coefficient		40		ppm/ $^{\circ}\text{C}$	
Hysteresis					
		6.3		mV	ADM6326/ADM6328
		9.5		mV	ADM6346/ADM6348
TIMING CHARACTERISTICS					
V_{CC} to Reset Delay (t_{RD})		20		μs	$V_{CC} = V_{TH}$ to $(V_{TH} - 100\text{ mV})$
Reset Active Timeout Period (t_{RP})	100	185	280	ms	
RESET OUTPUT VOLTAGE LOW, VOL			0.3	V	$V_{CC} > 2.1\text{ V}$, $I_{SINK} = 1.6\text{ mA}$, reset asserted
			0.4	V	$V_{CC} \geq 1.2\text{ V}$, $I_{SINK} = 100\text{ }\mu\text{A}$, reset asserted
RESET OUTPUT VOLTAGE HIGH, VOH	$0.8 \times V_{CC}$			V	ADM6326 only, $V_{CC} = 3.2\text{ V}$, $I_{SOURCE} = 500\text{ }\mu\text{A}$
	$0.8 \times V_{CC}$			V	ADM6326/ADM6346 only, $V_{CC} = 4.5\text{ V}$, $I_{SOURCE} = 800\text{ }\mu\text{A}$, $V_{TH} \leq 4.38\text{ V}$
	$0.8 \times V_{CC}$			V	ADM6326/ADM6346 only, $V_{CC} = V_{TH(MAX)}$, $I_{SOURCE} = 800\text{ }\mu\text{A}$, $V_{TH} \geq 4.5\text{ V}$
OPEN-DRAIN RESET OUTPUT LEAKAGE CURRENT			0.1	μA

¹ Not all device options are released for sale as standard models. See the Ordering Guide for full details.

ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Supply Voltage, V_{CC}	-0.3 V to +6 V
Input Current, I_{CC}	20 mA
Output Voltage	
Push-Pull \overline{RESET}	-0.3 V to ($V_{CC} + 0.3$ V)
Open-Drain \overline{RESET}	-0.3 V to +6 V
Output Current (\overline{RESET})	20 mA
Rate of Rise of V_{CC}	100 V/ μ s
Temperature	
Storage	-65°C to +155°C
Operating	-40°C to +85°C
Soldering (10 sec)	300°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 4. Thermal Resistance

Package Type	θ_{JA}	Unit
3-Lead SOT-23	270	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 3. ADM6326/ADM6328/ADM6346/ADM6348 Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	GND	Ground Reference for All Signals; 0 V.
2	RESET	Active Low Logic Output. This pin is low when V_{CC} is less than the reset threshold; it remains low for 185 ms (typical) after V_{CC} becomes greater than the reset threshold.
3	V_{CC}	Supply Voltage Being Monitored.

TYPICAL PERFORMANCE CHARACTERISTICS

Figure 4. Supply Current vs. Temperature

Figure 6. Power-Up Reset Timeout vs. Temperature

Figure 5. Maximum Transient Duration vs. Reset Threshold Overdrive

Figure 7. Power-Down Reset Delay vs. Temperature

THEORY OF OPERATION

The ADM6326/ADM6328/ADM6346/ADM6348 are designed to protect the integrity of a system's operation by ensuring the proper operation of the system during power-up, power-down, and brownout conditions. Ultralow supply currents make these devices particularly suitable for use in low power, portable equipment.

RESET OUTPUT

The ADM6326 and ADM6346 have an active low, push-pull reset output, whereas the ADM6328 and ADM6348 have an active low, open-drain reset output, which requires an external pull-up resistor. The $\overline{\text{RESET}}$ signal is guaranteed to be valid for V_{CC} down to 1 V.

When the ADM6326/ADM6328/ADM6346/ADM6348 are powered up, the $\overline{\text{RESET}}$ output remains low for a period typically equal to the $\overline{\text{RESET}}$ active timeout period of 185 ms. This feature allows adequate time for the system to power up correctly and for the power supply to stabilize before any devices are brought out of reset and are allowed to begin executing instructions. Initializing a system in this way provides a more reliable startup for microprocessor systems.

When the monitored voltage falls below its associated threshold (V_{TH}), $\overline{\text{RESET}}$ is asserted within 20 μs (typical). Asserting $\overline{\text{RESET}}$ this quickly means that the entire system can be reset at once before any part of the system's voltage falls below its recommended operating voltage. This system reset can avoid dangerous and/or erroneous operation of a microprocessor based system.

INTERFACING TO OTHER DEVICES

The active low, open-drain reset output of the ADM6328 and ADM6348 makes these devices ideal for integration with devices such as microprocessors with bidirectional reset pins. Simply connect the $\overline{\text{RESET}}$ output of the ADM6328 or ADM6348 to the $\overline{\text{RESET}}$ input of the microprocessor using a single pull-up resistor to allow either device to initiate a system reset (see Figure 8).

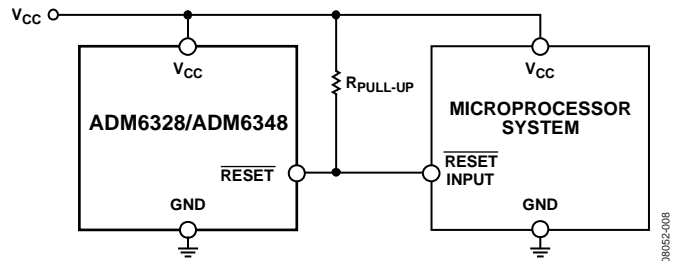

Figure 8. Interfacing to a Microprocessor with a Bidirectional Reset Pin

TRANSIENT IMMUNITY

To avoid unnecessary resets caused by fast power supply transients, the ADM6326/ADM6328/ADM6346/ADM6348 provide glitch immunity from negative-going V_{CC} transients.

Figure 5 shows the $\overline{\text{RESET}}$ comparator overdrive (that is, the maximum magnitude of negative-going pulses with respect to the typical threshold) vs. the pulse duration without a reset.

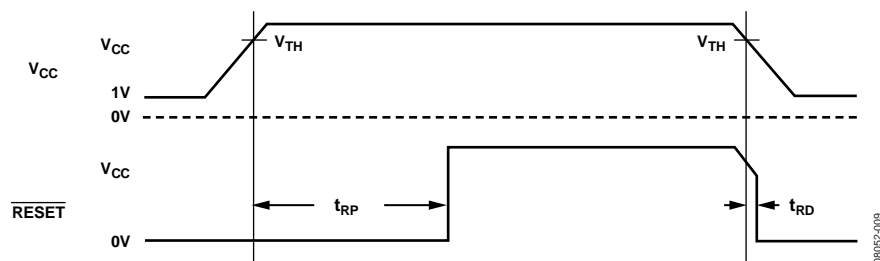

Figure 9. $\overline{\text{RESET}}$ Timing

¹ The ADM6326/ADM6328/ADM6346/ADM6348 include many device options; however, not all options are released for sale. Released options are called standard models and are listed in the Ordering Guide. For the most up to date list of standard models, check the [Single Supply Monitors IC](#) page on the Analog Devices website. Contact sales for information on nonstandard models and be aware that samples and production units have very long lead times.

² Z = RoHS Compliant Part.
