

Dual-/Triple-/Quad-Voltage, Capacitor-Adjustable, Sequencing/Supervisory Circuits

ABSOLUTE MAXIMUM RATINGS

(All voltages referenced to GND.)

V _{CC}	-0.3V to +30V
EN1-EN4	-0.3V to (V _{CC} + 0.3V)
OUT1-OUT4 (push-pull)	-0.3V to (V _{CC} + 0.3V)
OUT1-OUT4 (open-drain)	-0.3V to +30V
RESET (push-pull)	-0.3V to (V _{CC} + 0.3V)
RESET (open-drain)	-0.3V to 30V
IN1-IN4	-0.3V to (V _{CC} + 0.3V)
MR, TOL, TH1, TH0	-0.3V to (V _{CC} + 0.3V)
CDLY1-CDLY4	-0.3V to +6V

CRESET	-0.3V to (V _{CC} + 0.3V)
Input/Output Current (all pins)	±20mA
Continuous Power Dissipation (T _A = +70°C)	
16-Pin TQFN (derate 25mW/°C above +70°C)	2000mW
20-Pin TQFN (derate 25.6mW/°C above +70°C)	2051mW
24-Pin TQFN (derate 27.8mW/°C above +70°C)	2222mW
Operating Temperature Range	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature	+150°C
Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = 2.2V to 28V, T_A = -40°C to +125°C, unless otherwise specified. Typical values are at V_{CC} = 3.3V and T_A = +25°C.) (Note 1)

Dual-/Triple-/Quad-Voltage, Capacitor-Adjustable, Sequencing/Supervisory Circuits

MAX16025–MAX16030

Figure 2. Timing Diagram (CDLY_ Open)

Detailed Description

The MAX16025–MAX16030 are low-voltage, accurate, dual-/triple-/quad-voltage microprocessor (μP) supervisors in a small TQFN package. These devices provide supervisory and sequencing functions for complex multivoltage systems. The MAX16025/MAX16026 monitor two voltages, the MAX16027/MAX16028 monitor three voltages, and the MAX16029/MAX16030 monitor four voltages.

The MAX16025–MAX16030 offer independent outputs and enable functions for each monitored voltage. This configuration allows the device to operate as four separate supervisory circuits or be daisy-chained together to allow controlled sequencing of power supplies during

power-up initialization. When all of the monitored voltages exceed their respective thresholds, an independent reset output deasserts to allow the system processor to operate.

These devices offer enormous flexibility as there are nine threshold options that are selected through two threshold-select logic inputs. Each monitor circuit also offers an independent enable input to allow both digital and analog control of each monitor output. A tolerance select input allows these devices to be used in systems requiring 5% or 10% power-supply tolerances. In addition, the time delays and reset timeout can be adjusted using small capacitors. There is also a fixed 140ms minimum reset timeout feature.

Dual-/Triple-/Quad-Voltage, Capacitor-Adjustable, Sequencing/Supervisory Circuits

Applications Information

Tolerance

The MAX16025-MAX16030 feature a pin-selectable threshold tolerance. Connect TOL to GND to select the thresholds 5% below the nominal value. Connect TOL to V_{CC} to select the threshold tolerance 10% below the nominal voltage. Do not leave TOL unconnected.

Adjustable Input

These devices offer several monitoring options with both fixed and/or adjustable reset thresholds (see Table 2). For the adjustable threshold inputs, the threshold voltage (V_{TH}) at each adjustable IN₋ input is typically 0.5V (TOL = GND) or 0.472V (TOL = V_{CC}). To monitor a voltage V_{INTH}, connect a resistive divider network to the circuit as shown in Figure 3 and use the following equation to calculate the threshold voltage:

$$V_{INTH} = V_{TH} \times \left(1 + \frac{R1}{R2}\right)$$

Choosing the proper external resistors is a balance between accuracy and power use. The input to the voltage monitor is a high-impedance input with a small 100nA leakage current. This leakage current contributes to the overall error of the threshold voltage where the output is asserted. This induced error is proportional to the value of the resistors used to set the threshold. With lower value resistors, this error is reduced, but the amount of power consumed in the resistors increases.

Figure 3. Setting the Adjustable Input

The following equation is provided to help estimate the value of the resistors based on the amount of acceptable error:

$$R1 = \frac{e_A \times V_{INTH}}{I_L}$$

where e_A is the fraction of the maximum acceptable absolute resistive divider error attributable to the input leakage current (use 0.01 for $\pm 1\%$), V_{INTH} is the voltage at which the output (OUT₋) should assert, and I_L is the worst-case IN₋ leakage current (see the *Electrical Characteristics*). Calculate R2 as follows:

$$R2 = \frac{V_{TH} \times R1}{V_{INTH} - V_{TH}}$$

Unused Inputs

Connect any unused IN₋ and EN₋ inputs to V_{CC}.

OUT₋ Output

An OUT₋ goes low when its respective IN₋ input voltage drops below its specified threshold or when its EN₋ goes low (see Table 1). OUT₋ goes high when EN₋ is high and V_{IN₋} is above its threshold after a time delay. The MAX16025/MAX16027/MAX16029 feature open-drain, outputs while the MAX16026/MAX16028/MAX16030 have push-pull outputs. Open-drain outputs require an external pullup resistor to any voltage from 0 to 28V.

RESET Output

RESET asserts low when any of the monitored voltages (IN₋) falls below its respective threshold, any EN₋ goes low, or MR is asserted. RESET remains asserted for the reset timeout period after all of the monitored voltages exceed their respective threshold, all EN₋ are high, all OUT₋ are high, and MR is deasserted. The MAX16025/MAX16027/MAX16029 have an open-drain, active-low reset output, while the MAX16026/MAX16028/MAX16030 have a push-pull, active-low reset output. Open-drain RESET requires an external pullup resistor to any voltage from 0 to 28V.

Adjustable Reset Timeout Period (CRESET)

All of these parts offer an internally fixed reset timeout (140ms min) by connecting CRESET to V_{CC}. The reset timeout can also be adjusted by connecting a capacitor from CRESET to GND. When the voltage at CRESET reaches 0.5V, RESET goes high. When RESET goes high, CRESET is immediately held low.

Dual-/Triple-/Quad-Voltage, Capacitor-Adjustable, Sequencing/Supervisory Circuits

Calculate the reset timeout period as follows:

$$t_{RP} = \frac{V_{TH-RESET}}{I_{CH-RESET}} \times C_{CRESET} + 35 \times 10^{-6}$$

where $V_{TH-RESET}$ is 0.5V, $I_{CH-RESET}$ is 0.5μA, t_{RP} is in seconds, and C_{CRESET} is in Farads. To ensure timing accuracy and proper operation, minimize leakage at C_{CRESET} .

Adjustable Delay (CDLY_)

When V_{IN} rises above V_{TH} with EN_+ high, the internal 250nA current source begins charging an external capacitor connected from $CDLY_+$ to GND. When the voltage at $CDLY_+$ reaches 1V, OUT_+ goes high. When OUT_+ goes high, $CDLY_+$ is immediately held low. Adjust the delay (t_{DELAY}) from when V_{IN} rises above V_{TH} (with EN_+ high) to OUT_+ going high according to the equation:

$$t_{DELAY} = \frac{V_{TH-CDLY}}{I_{CH-CDLY}} \times C_{CDLY} + 35 \times 10^{-6}$$

where $V_{TH-CDLY}$ is 1V, $I_{CH-CDLY}$ is 0.25μA, C_{CDLY} is in Farads, t_{DELAY} is in seconds, and t_{DELAY+} is the internal propagation delay of the device. To ensure timing accuracy and proper operation, minimize leakage at $CDLY_+$.

Manual-Reset Input ($\overline{MR}$)

Many μP-based products require manual-reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. A logic-low on $\overline{MR}$ asserts $\overline{RESET}$ low. $\overline{RESET}$ remains asserted while $\overline{MR}$ is low and during the reset timeout period (140ms fixed or capacitor adjustable) after $\overline{MR}$ returns high. The $\overline{MR}$ input has a 500nA internal pullup, so it can be left unconnected, if not used. $\overline{MR}$ can be driven with TTL or CMOS logic levels, or with open-drain/collector outputs. Connect a normally open momentary switch from $\overline{MR}$ to GND to create a manual-reset function. External

debounce circuitry is not required. If $\overline{MR}$ is driven from long cables or if the device is used in a noisy environment, connect a 0.1μF capacitor from $\overline{MR}$ to GND to provide additional noise immunity.

Pullup Resistor Values

The exact value of the pullup resistors for the open-drain outputs is not critical, but some consideration should be made to ensure the proper logic levels when the device is sinking current. For example, if $V_{CC} = 2.25V$ and the pullup voltage is 28V, keep the sink current less than 0.5mA as shown in the *Electrical Characteristics* table. As a result, the pullup resistor should be greater than 56kΩ. For a 12V pullup, the resistor should be larger than 24kΩ. Note that the ability to sink current is dependent on the V_{CC} supply voltage.

Power-Supply Bypassing

The device operates with a V_{CC} supply voltage from 2.2V to 28V. When V_{CC} falls below the UVLO threshold, all the outputs go low and stay low until V_{CC} falls below 1.2V. For noisy systems or fast rising transients on V_{CC} , connect a 0.1μF ceramic capacitor from V_{CC} to GND as close to the device as possible to provide better noise and transient immunity.

Ensuring Valid Output with V_{CC} Down to 0V (MAX16026/MAX16028/MAX16030 Only)

When V_{CC} falls below 1.2V, the ability for the output to sink current decreases. In order to ensure a valid output as V_{CC} falls to 0V, connect a 100kΩ resistor from $OUT/\overline{RESET}$ to GND.

Typical Application Circuits

Figures 4 and 5 show typical applications for the MAX16025–MAX16030. In high-power applications, using an n-channel device reduces the loss across the MOSFETs as it offers a lower drain-to-source on-resistance. However, an n-channel MOSFET requires a sufficient V_{GS} voltage to fully enhance it for a low $R_{DS(on)}$. The application in Figure 4 shows the MAX16027 configured in a multiple-output sequencing application. Figure 5 shows the MAX16029 in a power-supply sequencing application using n-channel MOSFETs.
