Note 1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.

Note 3. Due to the limited drive capability use for input of the same package only.

Note 4. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential (GND) on the PCB.

Note 5. Max. limit only applicable for short durations, not for continuous operation!

AC ELECTRICAL CHARACTERISTICS

$V_{CC} = +3.3V \pm 10\%$; $C_L = 20pF$, $T_A = -40^\circ C$ to $+85^\circ C$ unless otherwise noted.

Symbol	Parameter	Condition	Min	Typ	Max	Units
f_{MAX}	Maximum Input Frequency	Note 6	275	—	—	MHz
t_{pd}	Propagation Delay		1.5	1.9	2.5	ns
t_{skpp}	Part-to-Part Skew	$V_{IN} \geq 100mV$, Note 7	—	—	0.5	ns

t_{JITTER}	Cycle-to-cycle (rms)	Note 9			2	μs_{RMS}
	Total jitter (pk-pk)	Note 10			15	μs_{PP}

Note 6. The f_{MAX} value is specified as the minimum guaranteed maximum frequency (While maintaining TTL swing of 0.8V to 2.0V). Actual operational maximum frequency may be greater.

Note 7. Part-to-Part Skew considering HIGH-to-HIGH transitions at common V_{CC} level.

Note 8. $V_{PP}(\min)$ is the minimum input swing for which AC parameters are guaranteed.

Note 9. Cycle-to-cycle jitter definition: The variation of periods between adjacent cycles, $T_n - T_{n-1}$, where T is the time between rising edges of the output signal.

Note 10. Total jitter definition: with an ideal clock input of frequency $\leq f_{MAX}$, no more than one output edge in 10^{12} output edge will deviate by more than the specified peak-to-peak jitter value.
