Notes

- See the last page of this specification for Group A subgroup testing information.
- For test purposes, not more than one output at a time should be shorted. Short circuit test duration should not exceed 30 seconds.
- See Introduction to CMOS PROMs in this Data Book for general information on testing.

Erase Characteristics

Wavelengths of light less than 4000 angstroms begin to erase the 7C265 in the windowed package. For this reason, an opaque label should be placed over the window if the PROM is exposed to sunlight or fluorescent lighting for extended periods of time.

The recommended dose of ultraviolet light for erasure is a wavelength of 2537 angstroms for a minimum dose (UV intensity • exposure time) of 25 Wsec/cm². For an ultraviolet lamp with a 12 mW/cm² power rating the exposure time would be approximately 45 minutes. The 7C265 needs to be within one inch of the lamp during erasure. Permanent damage may result if the PROM is exposed to high-intensity UV light for an extended period of time. 7258 Wsec/cm² is the recommended maximum dosage.

Programming Modes

The 7C265 offers a limited selection of programmed architectures. Programming these features should be done with a single 10-ms-wide pulse in place of the intelligent algorithm, mainly because these features are verified operationally, not with the VFY pin. Architecture programming is implemented by applying the supervoltage to two additional pins during programming. In programming the 7C265 architecture, VPP is applied to pins 3, 9, and 22. The choice of a particular mode depends on the states of the other pins during programming, so it is important that the condition of the other pins be met as set forth in the mode table. The considerations that apply with

respect to power-up and power-down during intelligent programming also apply during architecture programming. Once the supervoltages have been established and the correct logic states exist on the other device pins,

programming may begin. Programming is accomplished by pulling PGM from HIGH to LOW and then back to HIGH with a pulse width equal to 10 ms.
