

4-Mbit (256K × 16) Static RAM

Features

- Very high speed: 45 ns
- Wide voltage range: 2.2 V to 3.6 V and 4.5 V to 5.5 V
- Ultra low standby power
 - Typical Standby current: 2.5 μ A
 - Maximum Standby current: 7 μ A
- Ultra low active power
 - Typical active current: 3.5 mA at f = 1 MHz
- Easy memory expansion with $\overline{\text{CE}}$ and $\overline{\text{OE}}$ features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Available in Pb-free 44-pin thin small outline package (TSOP) II package

Functional Description

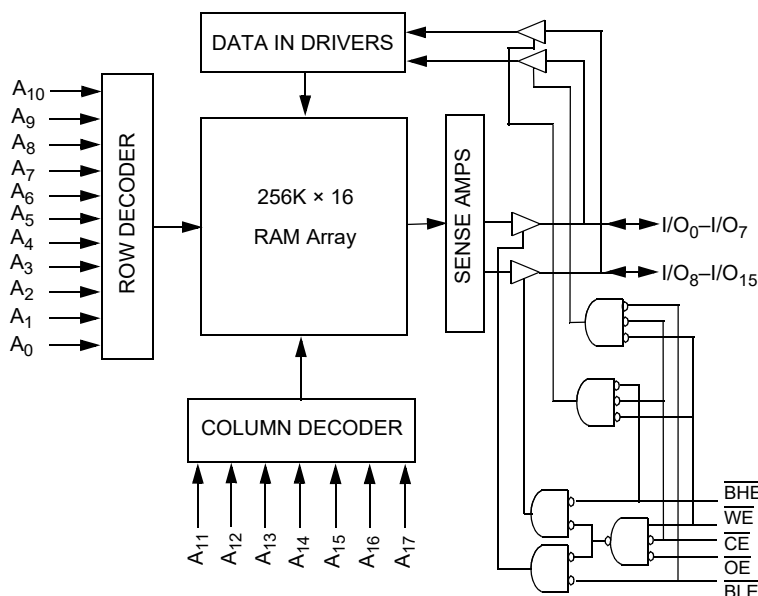

The CY62146ESL is a high performance CMOS static RAM organized as 256K words by 16 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected ($\overline{\text{CE}}$ HIGH). The input and output pins (I/O_0 through I/O_{15}) are placed in a high impedance state when the device is deselected ($\overline{\text{CE}}$ HIGH), the outputs are disabled ($\overline{\text{OE}}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{\text{BHE}}$, $\overline{\text{BLE}}$ HIGH) or during a write operation ($\overline{\text{CE}}$ LOW and $\overline{\text{WE}}$ LOW).

To write to the device, take Chip Enable ($\overline{\text{CE}}$) and Write Enable ($\overline{\text{WE}}$) inputs LOW. If Byte Low Enable ($\overline{\text{BLE}}$) is LOW, then data from I/O pins (I/O_0 through I/O_7) is written into the location specified on the address pins (A_0 through A_{17}). If Byte High Enable ($\overline{\text{BHE}}$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{17}).

To read from the device, take Chip Enable ($\overline{\text{CE}}$) and Output Enable ($\overline{\text{OE}}$) LOW while forcing the Write Enable ($\overline{\text{WE}}$) HIGH. If Byte Low Enable ($\overline{\text{BLE}}$) is LOW, then data from the memory location specified by the address pins appears on I/O_0 to I/O_7 . If Byte High Enable ($\overline{\text{BHE}}$) is LOW, then data from memory appears on I/O_8 to I/O_{15} . See the [Truth Table on page 11](#) for a complete description of read and write modes.

Notes

- NC pins are not connected on the die.
- Datasheet specifications are not guaranteed for V_{CC} in the range of 3.6 V to 4.5 V.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = 3 V, and V_{CC} = 5 V, T_A = 25 °C.

Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Notes

4. V_{IL}(min) = -2.0V for pulse durations less than 20 ns.

5. V_{IH}(max) = V_{CC} + 0.75 V for pulse durations less than 20 ns.

6. Full Device AC operation assumes a 100 μs ramp time from 0 to V_{CC} (min) and 200 μs wait time after V_{CC} stabilization.

7. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = 3 V, and V_{CC} = 5 V, T_A = 25 °C.

8. Chip enable (CE) must be HIGH at CMOS level to meet the I_{SB1}/I_{SB2}/I_{CCDR} spec. Other inputs can be left floating.

Notes

14. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Note [AN66311](#). However, the issue has been fixed and in production now, and hence, this Application Note is no longer applicable. It is available for download on our website as it contains information on the date code of the parts, beyond which the fix has been in production.
15. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3 V, and output loading of the specified I_{OL}/I_{OH} as shown in the [Figure 2 on page 5](#).
16. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
17. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high-impedance state.
18. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$, \overline{BHE} , \overline{BLE} or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
19. The minimum write cycle time for Write Cycle No. 4 (\overline{WE} Controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .

Switching Waveforms

Figure 4. Read Cycle No. 1 (Address Transition Controlled) [20, 21]

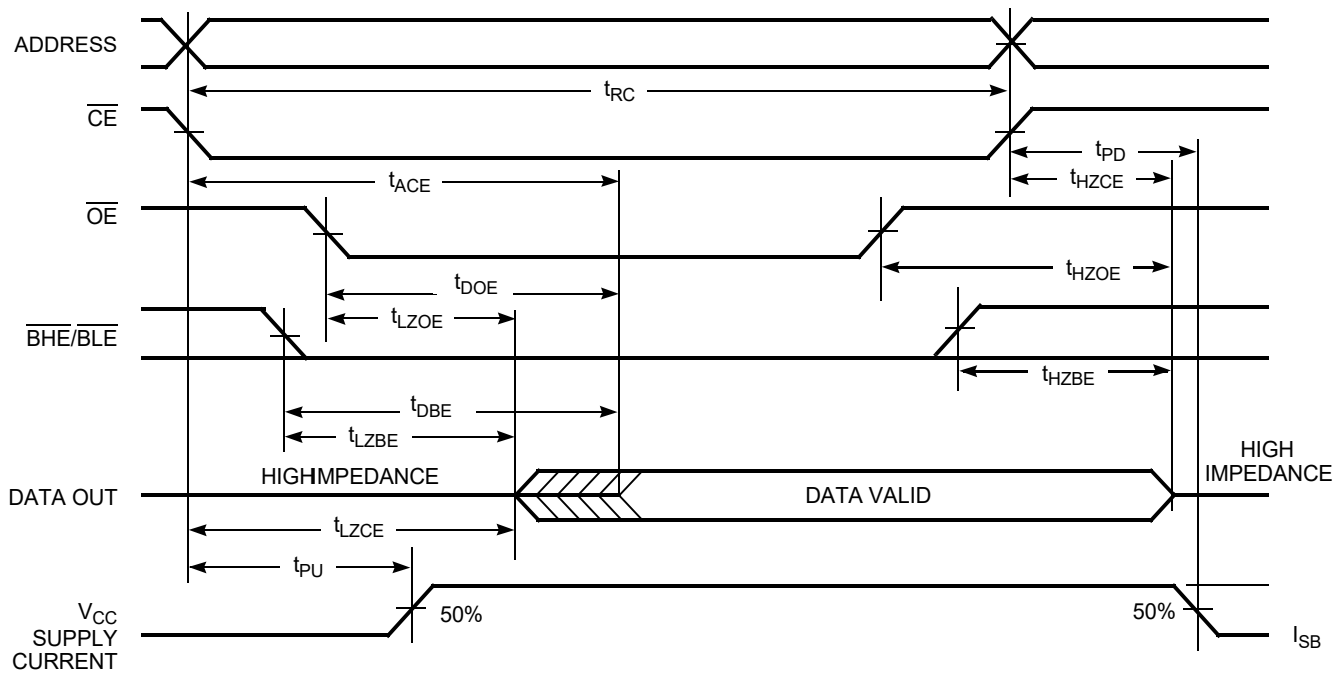

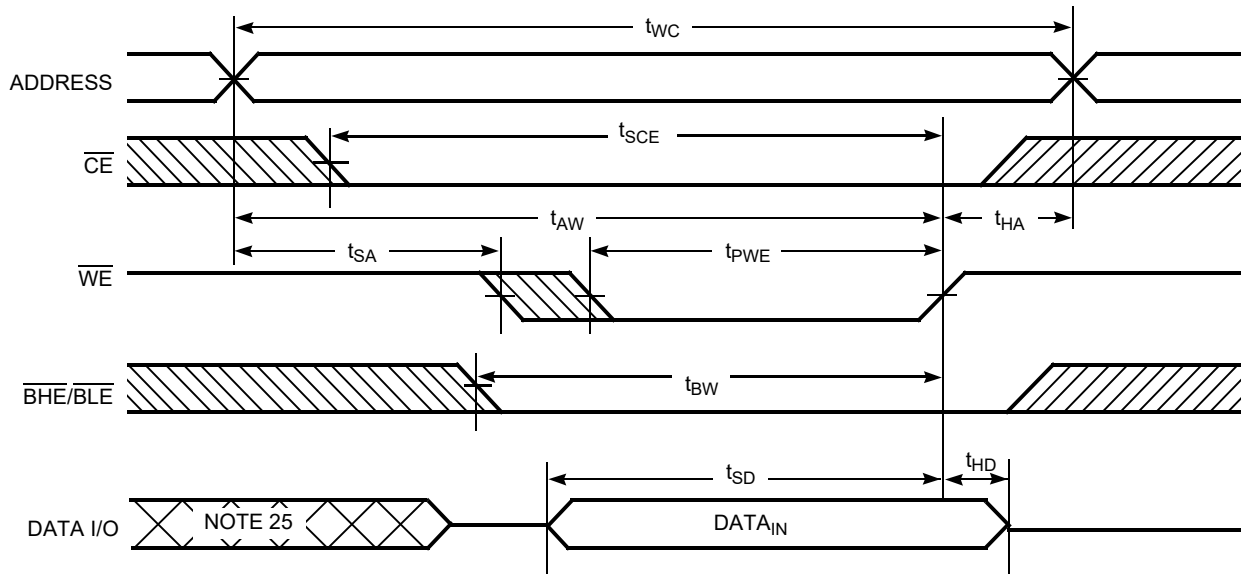

Figure 5. Read Cycle No. 2 (\overline{OE} Controlled) [21, 22]

Notes

20. The device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$, \overline{BHE} , \overline{BLE} , or both = V_{IL} .
 21. \overline{WE} is HIGH for read cycle.
 22. Address valid before or similar to \overline{CE} , \overline{BHE} , \overline{BLE} transition LOW.

Switching Waveforms (continued)

Figure 6. Write Cycle No. 1 ($\overline{\text{WE}}$ Controlled) [23, 24]

Figure 7. Write Cycle No. 2 ($\overline{\text{CE}}$ Controlled) [23, 24]

Notes

23. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}}$, $\overline{\text{CE}} = V_{IL}$, $\overline{\text{BHE}}$, $\overline{\text{BLE}}$ or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

24. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}} = V_{IH}$, the output remains in a high impedance state.

25. During this period, the I/Os are in output state. Do not apply input signals.

Figure 9. Write Cycle No. 4 ($\overline{\text{WE}}$ Controlled, $\overline{\text{OE}}$ LOW) [28]

Notes

26. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}} = V_{IH}$, the output remains in a high impedance state.

27. During this period, the I/Os are in output state. Do not apply input signals.

28. The minimum write cycle time for Write Cycle No. 4 ($\overline{\text{WE}}$ Controlled, $\overline{\text{OE}}$ LOW) is the sum of t_{HZWE} and t_{SD} .

Examples of High-Risk Devices are weapons, nuclear installations, surgical implants, and other medical devices. "Critical Component" means any component of a High-Risk Device whose failure to perform can be reasonably expected to cause, directly or indirectly, the failure of the High-Risk Device, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any use of a Cypress product as a Critical Component in a High-Risk Device. You shall indemnify and hold Cypress, its directors, officers, employees, agents, affiliates, distributors, and assigns harmless from and against all claims, costs, damages, and expenses, arising out of any claim, including claims for product liability, personal injury or death, or property damage arising from any use of a Cypress product as a Critical Component in a High-Risk Device. Cypress products are not intended or authorized for use as a Critical Component in any High-Risk Device except to the limited extent that (i) Cypress's published data sheet for the product explicitly states Cypress has qualified the product for use in a specific High-Risk Device, or (ii) Cypress has given you advance written authorization to use the product as a Critical Component in the specific High-Risk Device and you have signed a separate indemnification agreement.
