# 1.27 mm Connectors SMC Applications

Motherboard to daughter card in an ISDN equipment

Motherboard to daughter card for industrial PLCs

Mezzanine cards in mobile phone test equipment

Mezzanine cards for industrial automation

Board to cable for video coding backplane

Versatile configurations in an industrial controller

## 1.27 mm Connectors SMC

### Technical Features

Board-to-board and board-to-cable applications

Wide entry area alignment tolerance

Polarization of the mating face

Guaranteed coplanarity

Various pin versions

Rear I/O pressfit connectors on backplanes

## 1.27 mm Connectors SMC

SMC at a Glance

### Subassembly Design - Flexibility in Application

Straight and right angle male and female connectors, and other available options permit many configurations and variations for maximum flexibility in designing modules and manufacturing boards.

### Solution of Choice for Modern Subassembly Applications

Printed circuit board solutions for all kind of branches.

### Variable Board-to-Board Height

Flexible Board-to-Board heights ranging from 8.0 mm to 20.0 mm for subassembly solutions.

### Rear I/O connector on Multi-layer Backplanes

The pressfit versions of the SMC male connectors are ideal for transferring I/O signals on the rear side of a backplane.

### Simple I/O Signal Transfer with „Snap-Lock“ Female Cable Connector

The female IDC cable connectors with snap-lock feature make transferring I/O signals easy and also saves space by eliminating the need for ejector latches.

## 1.27 mm Connectors SMC

### SMC at a Glance

#### Completely Automated Manufacturing of SMC Connectors

SMC connectors are manufactured using controlled state of the art automated manufacturing equipment.

#### Controlled SMT Reflow Soldering Process

The heat-resistant thermoplastic insulation body and precision coplanar contacts permit a controlled SMT soldering process.

#### Reliable Insertion and Removal

The metal SMT mounting clip ensures a reliable connection to the printed circuit board. As a result of its special design, it can handle high insertion and withdrawal forces. The integrated metal clips are soldered during the SMT process, thus eliminating the need for an additional operation such as rivets.

#### Quality Check

A full inspection of the female contact apertures and coplanarity of our SMC connectors guarantees maximum reliability for your printed circuit boards.

#### Easy Recognition and Secure Handling

The black insulation body ensures easy visual recognition by the automatic pick and place equipment.

#### Safe Packaging for Fully Automated Assembly

The antistatic tape and reel packaging not only protects the high-precision contacts of our SMC connectors, but also permits placement of connectors by automated pick and place equipment.

## 1.27 mm Connectors SMC

### Mating Conditions

Allowed misalignment tolerances longitudinal and transverse axes:  $\pm 0.7$  mm

Allowed angular inclination tolerances longitudinal:  $\pm 4^\circ$ ; transverse:  $\pm 2^\circ$

Wipe length max. 2.5 mm / Board-to-Board distance 8-20 mm

All dimensions in mm

## 1.27 mm Connectors SMC

### Overhead Soldering

For industrial solutions, PCBs today are almost always assembled on both sides. The circuits are often very complex and in most cases it is not possible to assemble large components, such as connectors exclusively on one side. This leads to an increase of the importance of overhead solder able components.

Overhead soldering does not imply to the often implicated gluing and dip soldering process of an SMT assembled backplane, instead it is a two sided reflow solder process without an additional gluing process.

ERNI SMC connectors apply to this demand and are therefore suitable for overhead SMT soldering. While soldering the

2nd side, SMT overhead connectors are found on the “solder” side, meaning on the upside down side, whereas this already soldered side is completely melted again. The components have to be held up by adhesion and cohesion forces of the liquid solder paste. The adhesion forces are very critical and they grow proportional with the size of the solder pad.

Adjusting the size of the solder pad according to the weight of the connector, assures that the components will definitely stay in their position. This enables us to offer you an additional excellent option from our SMC family.

#### PCB side 1 Solder paste printing / Component assembly / Reflow solder process

#### PCB side 2 Solder paste printing / Component assembly / Reflow solder process

#### PCB Layout for Right Angle Connectors

Layout for vertical versions complies with the standard layout.

## 1.27 mm Connectors SMC

Advantages and benefits of 20-year development history

The ultra-reliable, dual-beam female contact, which mates on the bended, homogeneous surface, guarantees secure contact mating even in demanding environments.

The board anchors' outstanding retention forces minimize stress on the signal contacts while maximizing resistance to shock and vibration. The anchors guarantee a robust surface mount connection.

Documented shear force and tear-off force inspire confidence in surface mount connectors during their entire lifetime

Example SMC 50-pin:

- Shear force > 1000 N
- Tear-off force > 100 N

The closed insulation body allows male connectors to be backfilled on the PCB. This effectively prevents unwanted media to enter and enhances the excellent resistance against mechanical stress. Distortion-resistant, smooth contour of the insulation body assures mating reliability even after many years of use.

Geometrically different locating pegs for exact board placement allow best tolerance compensation for positive and negative tolerances.

### Board-on IDC Assembly Instructions

ERNI's Board-on IDC system offers the possibility to optimize cable connections in two ways. The compact size reduces the required area on the board and it is more cost effective than a conventional female – male connection.

Note that the Board-on IDC connector is to be soldered to the PCB before assembling the cable.

ERNI recommends the following:

- A layout proposal indicating the restricted area.
- Use upper and lower tooling to assemble the cable to the connector. Use a flat upper tool which covers the cable guide and is mounted to the press ram and a lower tool that completely supports the area beneath the connector assembly.
- Insert the entire PCB into a fixture for the best results so that one may concentrate on the operation of the press and holding the cable. The fixture should be fixed to the press base and have a method of aligning the PCB within the fixture using the perimeter of the PCB and/or alignment pins.
- Important consideration must be given to the assembly tools available. When using a hand lever press it must be noted that the PCB outside edge (or the fixture edge) to the connector center is smaller than the distance from the throat of the press to the connector center (dimension 'X').
- Adjust the press shut height to 5 mm [.197"]. Additional visual monitoring of a completed assembly is achieved when the recesses are visible and the slot between the cable guide and the connector is evenly shut.

Process

Slot

- Neither the PCB nor the components may be bent during the press-in process.
- The flat cable must be inserted in such a way that it protrudes on the end by 0-1 mm.
- The flat cable must be inserted 90° to the connector.
