1 Pin connections and block diagram

Figure 1. Pin connections (top view)

The diagram illustrates the internal architecture of the Philips R50000 car stereo receiver. It is divided into several functional sections:

- Inputs and Source Selection:** The top section shows various input terminals (FD1L+, FD1L-, FD1R+, FD1R-, FD2L+, FD2L-, FD2R+, FD2R-, SEL, SER, MD1, MD2G, MD2B, MD2S, SEN) connected to a series of selectors (MAIN SOURCE SELECTOR, MIXING SELECTOR, SECOND SOURCE SELECTOR) and a multiplexer.
- Signal Processing:** The signal path continues through an IN-GAIN + AUTO ZERO block, an IN-GAIN block, and a MUTE block. It then passes through a series of tone and volume controls (TREBLE, BASS, VOICE BANDPASS, LP, HP, SOFT MUTE, SOFT STEP VOLUME, COMPANDER, LOUDNESS, ANTI CLIP INPUT, LOUDNESS).
- AC Input and Amplification:** The ACIN section includes a SWINR, SWINL, ACINRF, ACINLR, ACINLF, and ACOUTL inputs, leading to a MIXER and various fader controls (MONO-FADER, MONO-FADER, MONO-FADER, MONO-FADER, MONO-FADER, MONO-FADER).
- Power and Control:** The bottom section shows the power supply (12V, 100V, 12V) and control lines (IIC BUS, SDA, SCL, OUTSWL, OUTSWR, OUTSSL, OUTSSR, SDA, SCL, QUAL, VDD, GND, CREF).

The diagram is labeled 'D00A/1130' in the bottom right corner.

2 Electrical specifications

$V_S = 9V$; $T_{amb} = 25^\circ C$; $R_L = 10k\Omega$; all gains = 0dB; $f = 1kHz$; unless otherwise specified.

Table 2. Electrical characteristics

Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit

3 Audioprocessor part

3.1 Audioprocessor part features

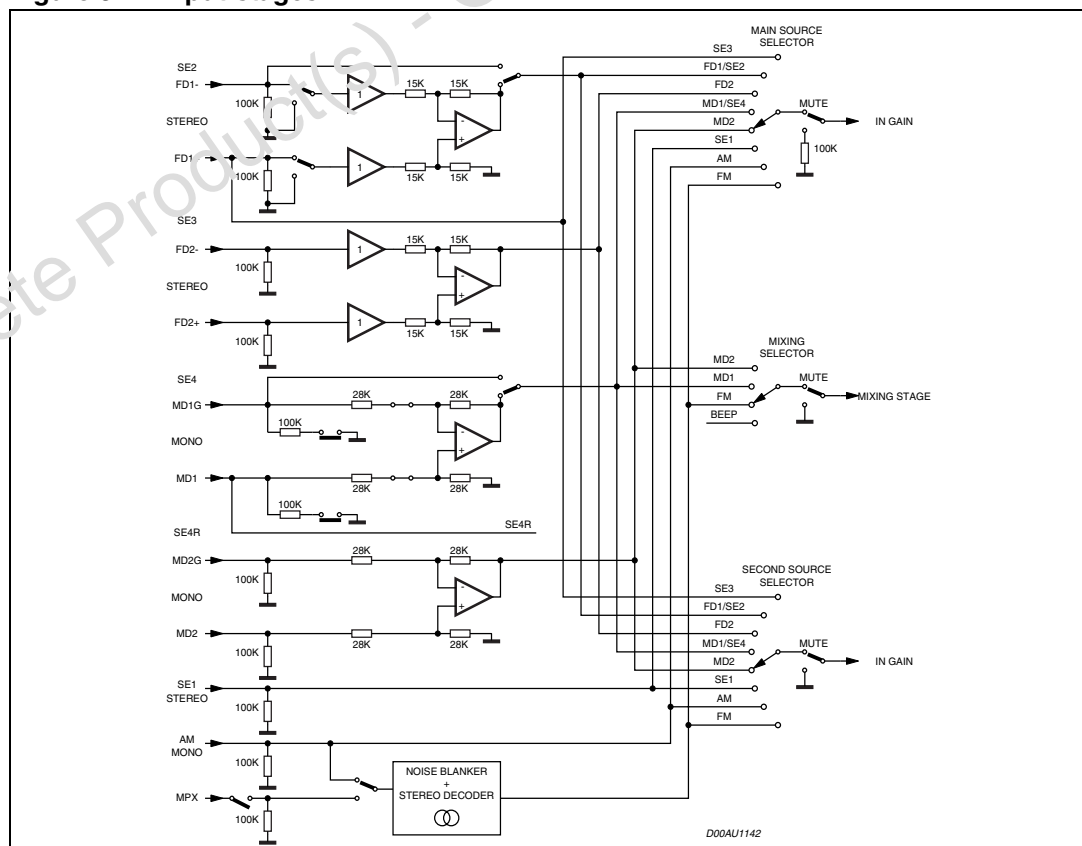

- Input multiplexer
 - 2 fully differential CD stereo inputs with programmable attenuation
 - 1 single ended stereo input
 - 2 differential mono input
 - 1 single ended mono input
 - In-gain 0..15dB, 1dB steps
 - internal offset cancellation (AutoZero)
 - separate second source selector
- Beep
 - internal beep with 4 frequencies
- Mixing stage
 - Beep, phone and navigation mixable to all speaker outputs
- Loudness
 - programmable center frequency and frequency response
 - 15 x 1dB steps
 - selectable flat-mode (constant attenuation)
- Volume
 - 0.5dB attenuator
 - 100dB range
 - soft-step control with programmable times
- Compressor
 - dynamic range compression for use with CD
 - 2:1 compression rate
 - programmable max. gain
- Bass
 - 2nd order frequency response
 - center frequency programmable in 8 steps
 - DC gain programmable
 - $\pm 15 \times 1\text{dB}$ steps
- Treble
 - 2nd order frequency response
 - center frequency programmable in 4 steps
 - $\pm 15 \times 1\text{dB}$ steps
- Voice bandpass
 - 2nd order butterworth highpass filter with programmable cut off frequency
 - 2nd order butterworth lowpass filter with programmable cut off frequency
 - selectable flat mode

- Speaker
 - 4 independent speaker controls in 1dB steps
 - control range 95dB
 - separate Mute
- Subwoofer
 - single ended stereo output
 - independent stereo level controls in 1dB steps
 - control range 95dB
 - separate Mute
- Mute Functions
 - direct mute
 - digitally controlled Soft Mute with 4 programmable mute-times
- Pause Detector
 - programmable threshold

3.2 Input stages

In the basic configuration two full differential, two mono differential, one single ended stereo and one single ended mono input are available. In addition a dedicated input for the stereo decoder MPX signal is present.

Figure 3. Input-stages

3.2.1 Full differential stereo input 1 (FD1)

The FD1 input is implemented as a buffered full-differential stereo stage with 100k Ω input impedance at each input. The attenuation is programmable in 3 steps from 0 to -12dB in order to adapt the incoming signal level. A 6dB attenuation is included in the differential stage, the additional 6dB are done by a following resistive divider. This input is also configurable as two single ended stereo inputs (see pin-out).

3.2.2 Full differential stereo input 2 (FD2)

The FD2 input has the same general structure as FD1, but with a programmable attenuation of 0 or 6dB embedded in the differential stage.

3.2.3 Mono differential input 1 (MD1)

The MD1 input is designed as a basic differential stage with 56k Ω input impedance. This input is configurable as a single ended stereo input (see pin-out).

3.2.4 Mono differential input 2 (MD2)

The MD2 input has the same topology as MD1, but without the possibility to configure it to single ended.

3.2.5 Single ended stereo input (SE1), single ended mono input (AM) and FM-MPX input

All single ended inputs offer an input impedance of 100k Ω . The AM pin can be connected by software to the input of the stereo-decoder in order to use the AM noiseblanker and AM High Cut feature.

3.3 AutoZero

The AutoZero allows a reduction of the number of pins as well as external components by canceling any offset generated by or before the In-Gain-stage (Please notice that externally generated offsets, e.g. generated through the leakage current of the coupling capacitors, are not canceled).

The auto zeroing is started every time the DATA-BYTE 0 is selected and needs max. **0.3ms** for the alignment. To avoid audible clicks the Audioprocessor is muted before the loudness stage during this time. The AutoZero feature is only present in the main signal path.

3.3.1 AutoZero for stereo decoder selection

A special procedure is recommended for selecting the stereo decoder at the **main** input-selector to guarantee an optimum offset cancellation:

1. Soft Mute or Mute the signal-path
2. Temporary deselect the stereo decoder at all input selectors
3. Configure the stereo decoder via IIC-Bus
4. Wait 1ms
5. Select the stereo decoder at the main input selector first

The root cause of this procedure is, that after muting the stereo decoder (Step 1), the internal stereo decoder filters have to settle in order to perform a proper offset cancellation.

3.3.2 AutoZero remain

In some cases, for example if the μ P is executing a refresh cycle of the I²C Bus programming, it is not useful to start a new AutoZero action because no new source is selected and an undesired mute would appear at the outputs. For such applications the TDA7402 could be switched in the **AutoZero Remain Mode** (Bit 6 of the subaddress byte). If this bit is set to high, the DATABYTE 0 could be loaded without invoking the AutoZero and the old adjustment value remains.

3.4 Pause detector / MUX-output

The pin number 40 (Pause/MUX) is configurable for two different functions:

1. During pause detector OFF this pin is used as a mono output of the main input selector. This signal is often used to drive a level/equalizer display on the car radio front panel.
2. During pause detector ON the pin is used to define the time constant of the detector by an external capacitor. The pause detector is driven by the internal stereo decoder outputs in order to use pauses in the FM signal for alternate frequency jumps. If the signal level of both stereo decoder channels is outside the programmed voltage window, the external capacitor is abruptly discharged. Inside the pause condition the capacitor is slowly recharged by a constant current of 25 μ A. The pause information is also available via I²C Bus (see I²C Bus programming).

3.4.1 Loudness

There are four parameters programmable in the loudness stage:

3.4.2 Attenuation

Figure 4 shows the attenuation as a function of frequency at $f_p = 400\text{Hz}$

Figure 4. Loudness attenuation @ $f_p = 400\text{Hz}$.

3.4.3 Peak frequency

Figure 5 shows the four possible peak-frequencies at 200, 400, 600 and 800Hz

Figure 5. Loudness center frequencies @ Attn. = 15dB.

3.4.4 Loudness order

Different shapes of 1st and 2nd-order loudness

Figure 6. 1st and 2nd order loudness @ Attn. = 15dB, $f_p=400\text{Hz}$

3.4.5 Flat mode

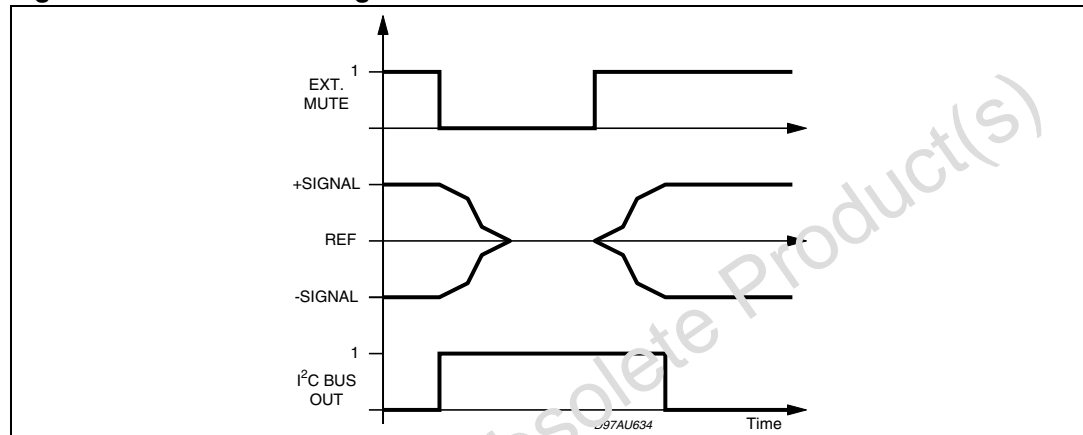

In flat mode the loudness stage works as a 0dB to -19dB attenuator.

3.5 Soft Mute

The digitally controlled Soft Mute stage allows muting/demuting the signal with a I²C bus programmable slope. The mute process can either be activated by the Soft Mute pin or by the I²C-bus. This slope is realized in a special S-shaped curve to mute slow in the critical regions (see [Figure 7](#)).

For timing purposes the Bit0 of the I²C bus output register is set to 1 from the start of muting until the end of de-muting.

Figure 7. Soft Mute timing

Note: Please notice that a started mute act on is always terminated and could not be interrupted by a change of the mute -signal.

3.6 Soft Step volume

When the volume level is changed audible clicks could appear at the output. The root cause of those clicks could either be a DC offset before the volume stage or the sudden change of the envelope of the audio signal. With the Soft Step feature both kinds of clicks could be reduced to a minimum and are no more audible. The blend time from one step to the next is programmable in four steps.

Figure 8. Soft Step timing

Note: For steps more than 0.5dB the Soft Step mode should be deactivated because it could generate a hard 1dB step during the blend time.

3.7 Bass

There are four parameters programmable in the bass stage:

3.7.1 Attenuation

Figure 9 shows the attenuation as a function of frequency at a center frequency of 80Hz.

Figure 9. Bass control @ $f_C = 80\text{Hz}$, $Q = 1$

3.7.2 Center frequency

Figure 10 shows the eight possible center frequencies 60, 70, 80, 90, 100, 130, 150 and 200Hz.

Figure 10. Bass center frequencies @ gain = 14dB, $Q = 1$

3.7.3 Quality factors

Figure 11 shows the four possible quality factors 1, 1.25, 1.5 and 2.

Figure 11. Bass quality factors @ Gain = 14dB, $f_c = 80\text{Hz}$

3.7.4 DC mode

In this mode the DC-gain is increased by 4.4dB. In addition the programmed center frequency and quality factor is decreased by 25% which can be used to reach alternative center frequencies or quality factors.

Figure 12. Bass normal and DC Mode @ Gain = 14dB, $f_c = 80\text{Hz}$

Note: The center frequency, Q and DC-mode can be set fully independently.

3.8 Treble

There are two parameters programmable in the treble stage:

3.8.1 Attenuation

Figure 13. shows the attenuation as a function of frequency at a center frequency of 17.5kHz.

Figure 13. Treble control @ $f_c = 17.5\text{kHz}$

3.8.2 Center frequency

Figure 14. shows the four possible center frequencies 10k, 12.5k, 15k and 17.5kHz.

Figure 14. Treble center frequencies @ gain = 14dB

3.9 Subwoofer application

Figure 15. Subwoofer application with LPF 80/120/160Hz and HPF 90/135/180Hz

Both filters, the lowpass and the highpass-filter, have butterworth characteristics so that their cut off frequencies are not equal, but shifted by the factor 1.125 to get a flat frequency response.

3.10 Voice band application

Figure 16. Voice band application with HPF 300/450/600/750Hz and LPF 3k/6kHz

3.11 Comander

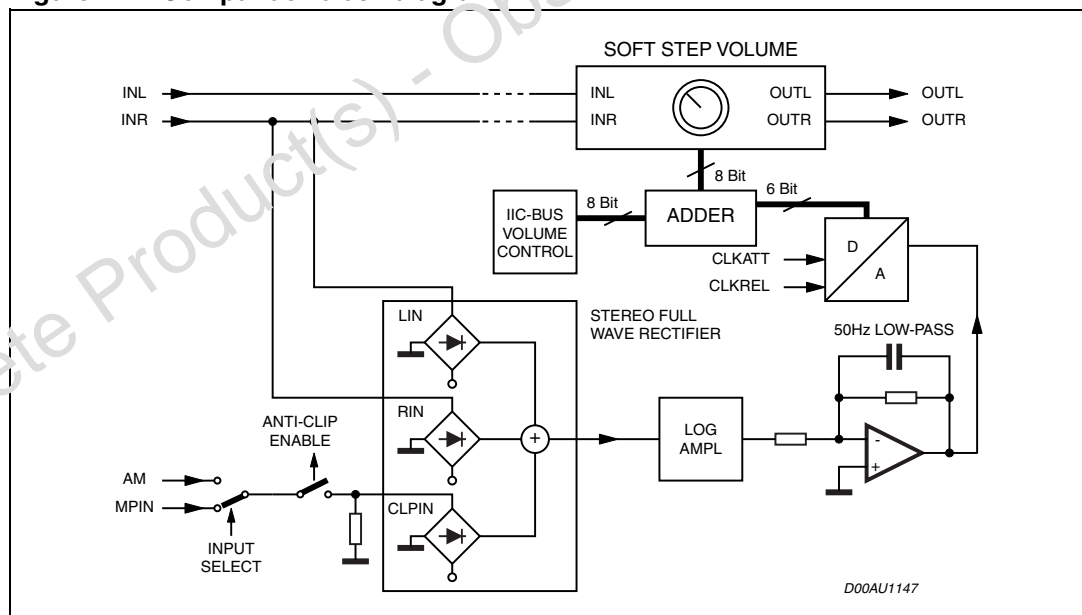

Signal compression

A fully integrated signal compressor with programmable attack and decay times is present in the TDA7402 (see [Figure 17](#)).

The comander consists of a signal level detection, an A/D Converter plus adder and the normal Soft Step volume stage. First of all the left and the right InGain-signal is rectified, respectively, and the logarithm is build from the summed signal. The following low-pass smooth the output-signal of the logarithm amplifier and improves the low frequency suppression. The low pass output-voltage then is A/D converted and added to the current volume-word defined by the I²C bus. Assuming reference level or higher at the comander input, the output of the ADC is 0. At lower levels the voltage is increasing with 1Bit/dB. It is obvious that with this configuration and a 0.5dB-step volume stage the compression rate is fixed to 2:1 (1dB less at the input leads to 0.5dB less at the output).

The internal reference level of the comander is programmable in three steps from 0.5V_{RMS} to 2V_{RMS}. For a proper behavior of the compression circuit it is mandatory to have at a 0dB input signal exactly the programmed reference level after the InGain-stage. E.g. at a configured reference-level of 0.5V_{RMS} the output of the InGain stage has to have also 0.5V_{RMS} at 0dB source-signal (Usually the 0dB for CD is defined as the maximum possible signal-level). To adapt the external level to the internal reference level the programmable attenuation in the differential stages and the InGain can be used.

Figure 17. Comander block diagram

3.11.1 Anti-clipping

In a second application the comander-circuit can be used for a anti-clipping or limiting function. In this case one of the dedicated inputs (AM or MPin) is connected directly to the clip-detector of the power-amplifier. If no clipping is detected, the open-collector output of the power-amplifier is highohmic and the input-voltage of the rectifier is V_{REF}. The level detector interprets this as a very small signal and reacts with the maximum programmed comander gain. In the application this gain has to be compensated by decreasing the

volume with the same value in order to get the desired output-level. In clipping situation the open collector current generates a voltage drop at the rectifier input, which forces the compander to decrease the gain until the clipping disappears.

It is even possible to run the compression mode and the anti-clipping mode in parallel. In this case the maximum compander gain should be set to 29dB.

3.11.2 Characteristic

To achieve the desired compression characteristic like shown below the volume has to be decreased by 4dB.

Figure 18. Compander characteristic

3.11.3 I²C bus timing

While the compander is working, a volume word coming from this stage is added to the I²C bus volume word and the volume is changed with a soft slope between adjacent steps (Soft Step stage). As mentioned in the description of this stage, it is not recommended to change the volume during this slope. To avoid this while the compander is working and the volume has to be changed, the compander hold-bit is implemented (Bit 7 in the subaddress byte). The recommended timing for changing the volume during compander ON is the following:

1. Set the compander hold bit
2. Wait the actual Soft Step time
3. Change the volume
4. Reset the compander hold bit

The Soft Step times are in compander ON condition automatically adapted to the attack time of the compander. In the following table the related Soft Step times are shown:

Table 6. Attack times vs. soft-step times

Attack time	Soft Step time
6ms	0.16ms
12ms	0.32ms
24ms	0.64ms
48ms	1.28ms

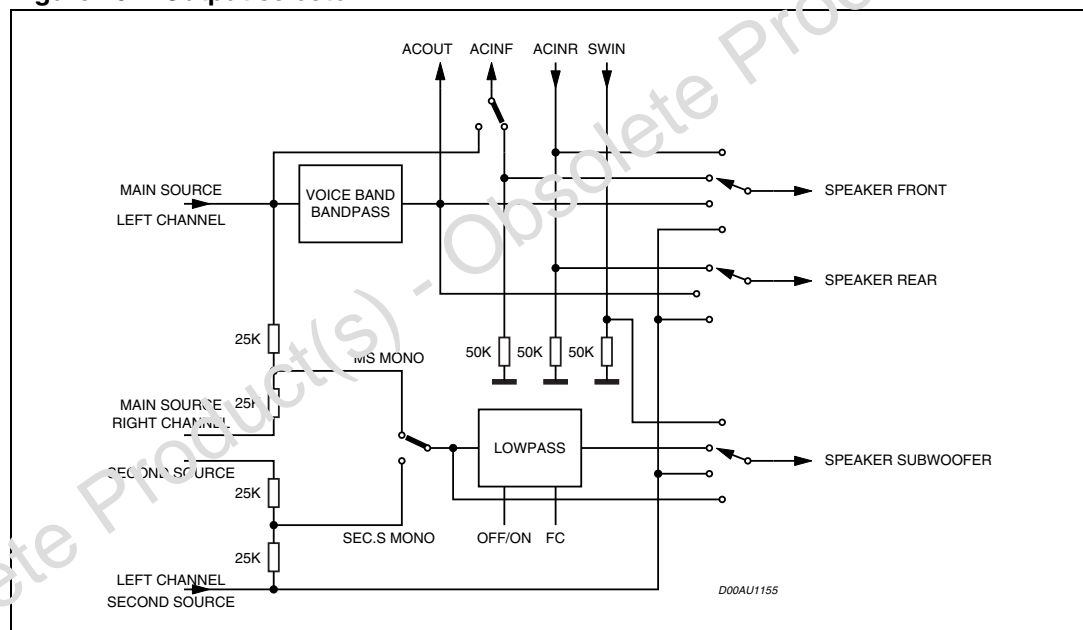

3.12 AC coupling

In some applications additional signal manipulations are desired, for example surround sound or more band equalizing. For this purpose an AC coupling is placed before the speaker attenuator, which can be activated or internally shorted by the I²C bus. In short condition the input signal of the speaker attenuator is available at the AC outputs. The input impedance of this AC Inputs is 50k Ω .

3.13 Output selector

The output-selector allows to connect the main- or the second-source to the front, rear and subwoofer speaker attenuator, respectively. As an example of this programming the device is able to connect via software the main source to the back (rear) and the second source to the front (see [Figure 17](#)). In addition to this stage allows to setup different applications by I²C bus programming. Three examples are given in [Figure 18](#), [19](#), and [20](#).

Figure 19. Output selector

3.14 Subwoofer

Several different applications are possible with the subwoofer circuit:

1. Subwoofer filter OFF
 - a) Main source stereo (AC coupled)
 - b) Second source stereo (DC coupled)
 - c) Main source mono differential (DC coupled)
 - d) Second source mono-differential (DC coupled)
2. Subwoofer filter ON
 - a) Main source mono differential (DC coupled)
 - b) Second source mono differential (DC coupled)
 - c) Center speaker mode (filtered mono signal at SWL, unfiltered mono signal at SWR)

In all applications the phase of the output-signal can be configured to be 0° or 180°. In the center speaker mode only at the filtered output the phase is changed.

Figure 20. Application 1 using internal highpass and mono low pass filter

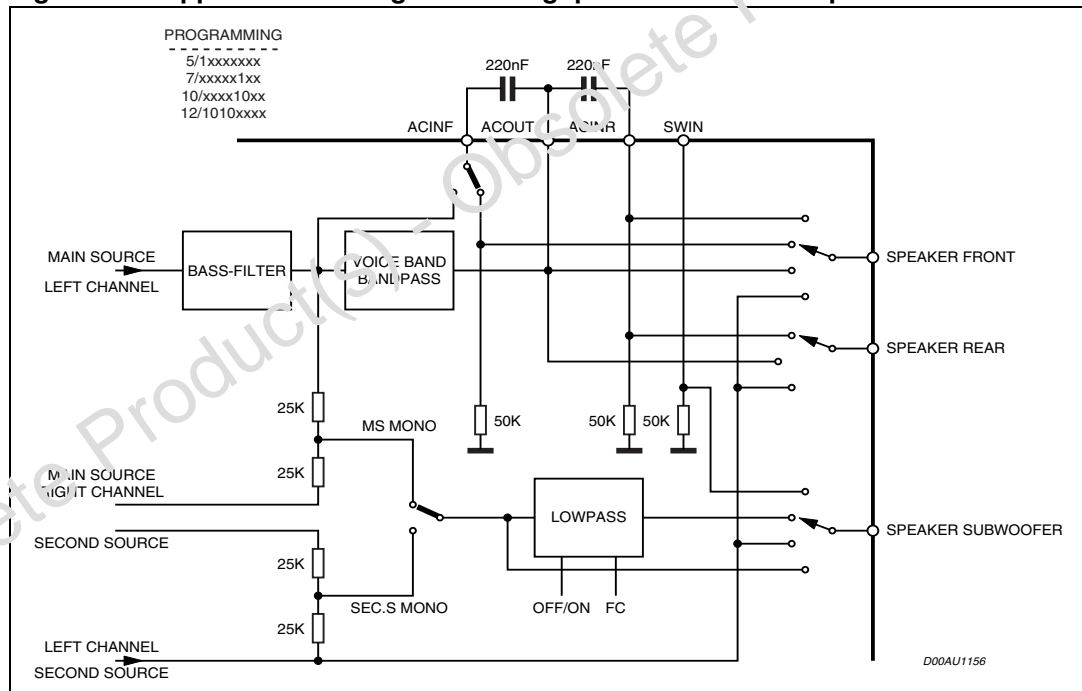

Figure 21. Application 2 using internal highpass and external stereo low pass filter

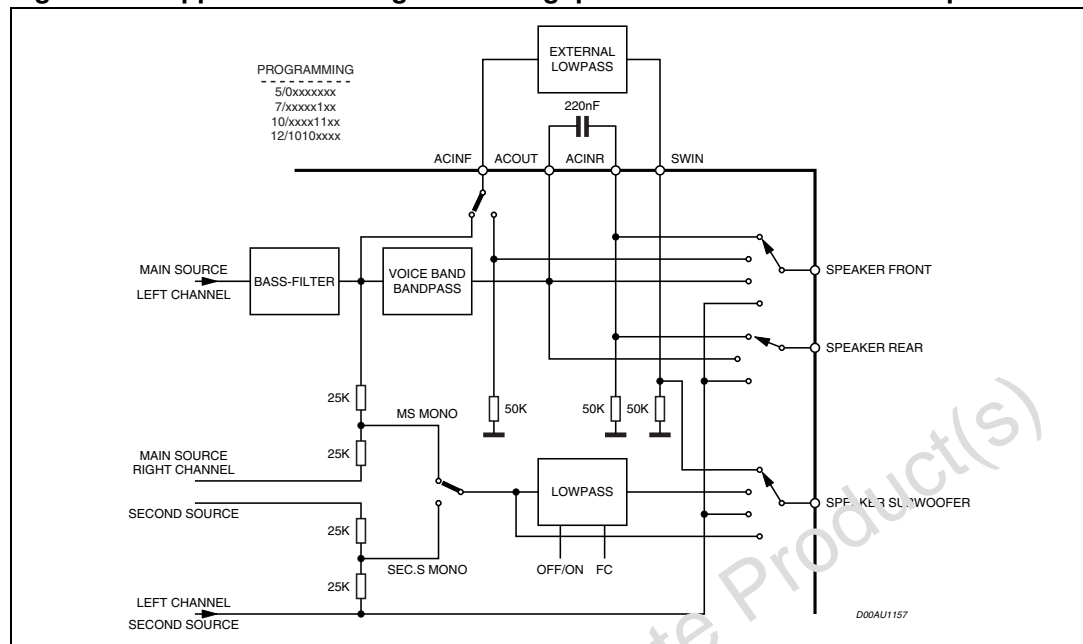

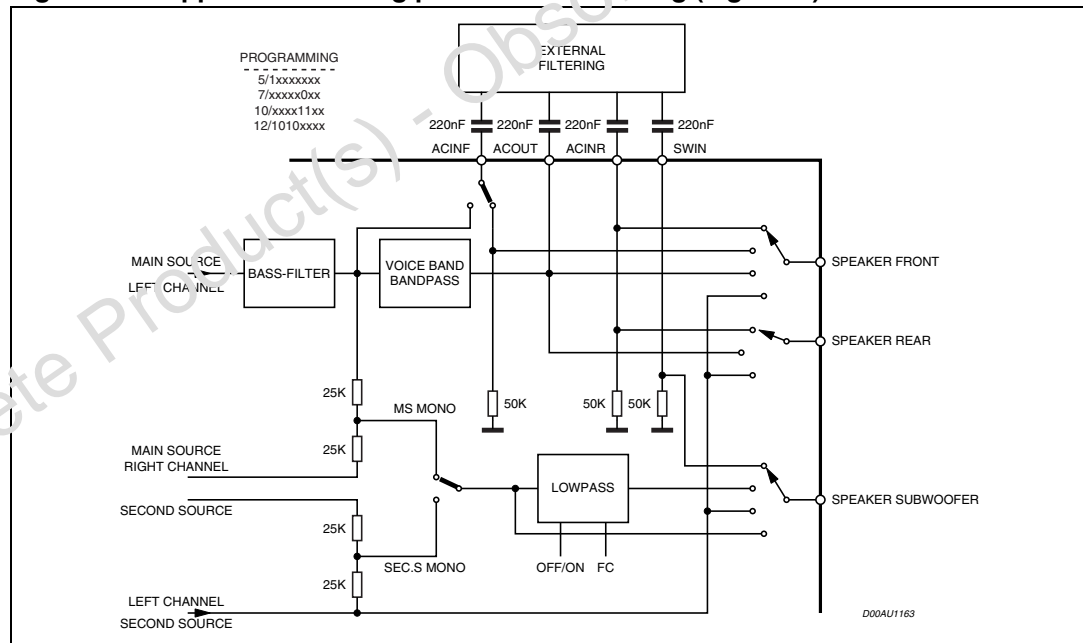

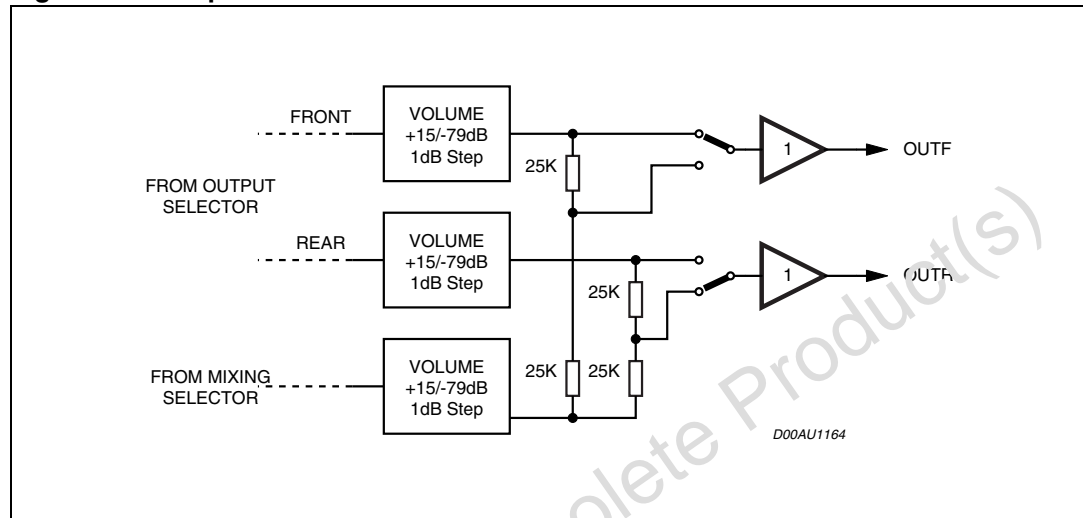

Figure 22. Application 3 using pure external filtering (e.g. DSP)

3.15 Speaker attenuator and mixing

A mixing-stage is placed after each speaker attenuator and can be set independently to mixing mode. Having a full volume for the mix signal the stage offers a wide flexibility to adapt the mixing levels.

Figure 23. Output selector

3.16 Audioprocessor testing

During the testmode, which can be activated by setting bit D_0 of the stereo decoder testing byte **and** the audioprocessor testing byte, several internal signals are available at the FD2R pin. During this mode the input resistance of 100kOhm is disconnected from the pin. The internal signals available are shown in the data byte specification.

4 Stereo decoder part

4.1 Stereo decoder part features

- No external components necessary
- PLL with adjustment free, fully integrated VCO
- Automatic pilot dependent MONO/STEREO switching
- Very high suppression of intermodulation and interference
- Programmable roll off compensation
- Dedicated RDS-Soft Mute
- Highcut and stereo blend-characteristics programmable in a wide range
- FM/AM noiseblanker with several threshold controls
- Multipath-detector with programmable internal/external influence
- I²C-bus control of all necessary functions

4.2 Stereo decoder electrical characteristics

$V_S = 9V$, de-emphasis time constant = 50 μ s, MPX input voltage $V_{MPX} = 500mV$ (75kHz deviation), modulation frequency = 1kHz, input gain = 6dB, $T_{amb} = 27^\circ C$, unless otherwise specified.

Table 7. Stereo decoder electrical characteristics

4.3 Notes about the characteristics

4.3.1 Intermodulation suppression

$$\alpha_2 = \frac{V_O(\text{signal})(\text{at } 1\text{kHz})}{V_O(\text{spurious})(\text{at } 1\text{kHz})}; f_s = (2 \cdot 10\text{kHz}) - 19\text{kHz}$$

$$\alpha_3 = \frac{V_O(\text{signal})(\text{at } 1\text{kHz})}{V_O(\text{spurious})(\text{at } 1\text{kHz})}; f_s = (3 \cdot 13\text{kHz}) - 38\text{kHz}$$

measured with: 91% pilot signal; $f_m = 10\text{kHz}$ or 13kHz .

4.3.2 Traffic radio (V.F.) suppression

$$\alpha_{57}(\text{V.W.F.}) = \frac{V_O(\text{signal})(\text{at } 1\text{kHz})}{V_O(\text{spurious})(\text{at } 1\text{kHz} \pm 23\text{kHz})}$$

measured with: 91% stereo signal; 9% pilot signal; $f_m=1\text{kHz}$; 5% subcarrier ($f=57\text{kHz}$, $f_m=23\text{Hz}$ AM, $m=60\%$)

4.3.3 SCA (subsidiary communications authorization)

$$\alpha_{67} = \frac{V_O(\text{signal})(\text{at } 1\text{kHz})}{V_O(\text{spurious})(\text{at } 1\text{kHz})}; f_s = (2 \cdot 38\text{kHz}) - 67\text{kHz}$$

measured with: 81% mono signal; 9% pilot signal; $f_m=1\text{kHz}$; 10%SCA - subcarrier ($f_s = 67\text{kHz}$, unmodulated).

4.3.4 ACI (adjacent channel interference)

$$\alpha_{114} = \frac{V_O(\text{signal})(\text{at } 1\text{kHz})}{V_O(\text{spurious})(\text{at } 4\text{kHz})}; f_s = 110\text{kHz} - (3 \cdot 38\text{kHz})$$

$$\alpha_{190} = \frac{V_O(\text{signal})(\text{at } 1\text{kHz})}{V_O(\text{spurious})(\text{at } 4\text{kHz})}; f_s = 186\text{kHz} - (5 \cdot 38\text{kHz})$$

measured with: 90% mono signal; 9% pilot signal; $f_m=1\text{kHz}$; 1% spurious signal ($f_s = 110\text{kHz}$ or 186kHz , unmodulated).

4.4 Noise blanker part

4.4.1 Noise blanker part features

- AM and FM mode
- internal 2nd order 140kHz high-pass filter for MPX path
- internal rectifier and filters for AM-IF path
- programmable trigger thresholds
- trigger threshold dependent on high frequency noise with programmable gain
- additional circuits for deviation and field strength dependent trigger adjustment
- 4 selectable pulse suppression times for each mode
- programmable noise rectifier charge/discharge current

All parameters measured in FM mode if not otherwise specified.

Table 8. Noise blanker electrical characteristics

5 Functional description of stereo decoder

Figure 28. Block diagram of stereo decoder

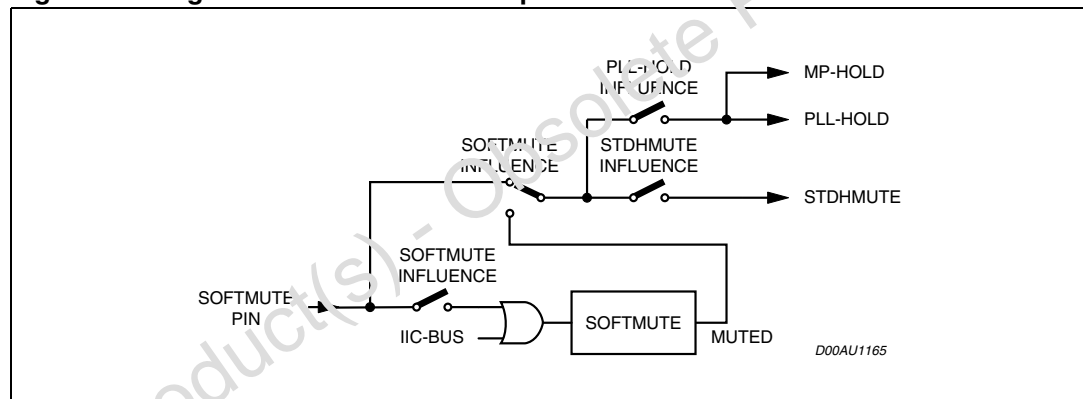

The stereo decoder-part of the TDA7402 (see [Figure 28](#)) contains all functions necessary to demodulate the MPX-signal like pilot tone dependent Mono/Stereo switching as well as "stereo blend" and "highcut". Adaptations like programmable input gain, roll off compensation, selectable de-emphasis time constant and a programmable fieldstrength input allow to use different IF devices.

5.1 Stereo decoder mute

The TDA7402 has a fast and easy to control RDS mute function which is a combination of the audioprocessor's Soft Mute and the high ohmic mute of the stereo decoder. If the stereo decoder is selected and a Soft Mute command is sent (or activated through the SM-pin) the stereo decoder will be set automatically to the high-ohmic mute condition after the audio-signal has been softmuted. Hence a checking of alternate frequencies could be performed. Additionally the PLL can be set to "Hold" mode, which disables the PLL input during the mute time. To release the system from the mute condition simply the unmute command must be sent: the stereo decoder is unmuted immediately and the audioprocessor is softly unmuted. [Figure 29](#) shows the output-signal V_O as well as the internal stereo decoder mute signal. This influence of Soft Mute on the stereo decoder mute can be switched off by setting bit 3 of the Soft Mute byte to "0". A stereo decoder mute command (bit 0, stereo decoder byte set to "1") will also set the stereo decoder independently to the high-ohmic mute state.

If any other source than the stereo decoder is selected the decoder remains muted and the MPX pin is connected to V_{ref} to avoid any discharge of the coupling capacitor through leakage currents. No further mute command should be applied.

Figure 29. Signals during stereo decoder's Soft Mute**Figure 30. Signal control via Soft Mute pin**

5.2 InGain + infilter

The InGain stage allows adjustment of the MPX-signal to a magnitude of about $1V_{rms}$ internally, which is the recommended value. The 4th order input filter has a corner frequency of 80kHz and is used to attenuate spikes and noise, and acts as an anti-aliasing filter for the following switch capacitor filters.

5.3 Demodulator

In the demodulator block, the left and the right channels are separated from the MPX signal. In this stage the 19kHz pilot tone is cancelled. To reach a high channel separation the TDA7402 offers an I²C bus programmable roll-off adjustment which is able to compensate for the lowpass behavior of the tuner section. If the tuner's attenuation at 38kHz is in a range from 7.2% to 31.0%, the TDA7402 needs no external network in front of the MPX-pin. Within this range, an adjustment to obtain at least 40dB channel separation is possible. The bits for this adjustment are located together with the fieldstrength adjustment in one byte. This gives the possibility to perform an optimization step during the production of the car radio, where

the channel separation and the fieldstrength control are trimmed. The setup of the stereo blend characteristics which is programmable in a wide range is described in [Chapter 5.8](#).

5.4 De-emphasis and highcut

The de-emphasis lowpass allows to choose a time constant between 37.5 and 100µs. The highcut control range will be $2 \times \tau_{\text{Deemp}}$ or $2.7 \times \tau_{\text{Deemp}}$ dependent on the selected time constant (see programming section). The bit D7 of the highcut-byte will shift timeconstant and range.

Inside the highcut control range (between VHCH and VHCL) the LEVEL signal is converted into a 5 bit word which controls the lowpass time constant between $\tau_{\text{Deemp}} \dots 3 (3.7) \times \tau_{\text{Deemp}}$. Thereby the resolution will remain always 5 bits independently of the absolute voltage range between the VHCH and VHCL values. In addition the maximum attenuation can be fixed between 2 and 10dB.

The highcut function can be switched off by I²C bus (bit D₇, Highcut byte set to "0").

The setup of the highcut characteristics is described in [Chapter 5.9](#).

5.5 PLL and pilot tone detector

The PLL has the task to lock on the 19kHz pilot tone during a stereo transmission to allow a correct demodulation. The included pilot tone detector enables the demodulation if the pilot tone reaches the selected pilot tone threshold V_{PTHST} . Two different thresholds are available. The detector output (signal STEREO, see [Figure 2: Block diagram](#)) can be checked by reading the status byte of the TDA7402 via I²C-bus. During a Soft Mute the PLL can be set into "Hold"-mode which freezes the PLL's state (bit D₄, Soft Mute byte). After releasing the Soft Mute the PLL will again follow the input signal only by correcting the phase error.

5.6 Fieldstrength control

The fieldstrength input is used to control the highcut and the stereo blend function. In addition the signal can be also used to control the noiseblanker thresholds and as input for the multipath detector. These additional functions are described in sections [5.3](#) and [6](#).

5.7 LEVEL input and gain

To suppress undesired high frequency modulation on the highcut- and stereo blend-control signal the LEVEL signal is lowpass filtered firstly. The filter is a combination of a 1st order RC lowpass at 53kHz (working as anti-aliasing filter) and a 1st-order switched capacitor lowpass at 2.2kHz. The second stage is a programmable gain stage to adapt the LEVEL signal internally to different IF devices (see Testmode section 5: LEVELHCC). The gain is widely programmable in 16 steps from 0dB to 6dB (step=0.4dB). These 4 bits are located together with the Roll-Off bits in the "Stereo decoder adjustment" byte to simplify a possible adjustment during the production of the car radio. This signal controls directly the Highcut stage whereas the signal is filtered again ($f_c=100\text{Hz}$) before the stereo blend stage (see [Figure 35](#)).

5.8 Stereo blend control

The stereo blend control block converts the internal LEVEL voltage (LEVELSB) into an demodulator compatible analog signal which is used to control the channel separation between 0dB and the maximum separation. Internally this control range has a fixed upper limit which is the internal reference voltage REF5V. The lower limit can be programmed between 20 and 70% of REF5V in 3.3% steps (see [Figure 31](#) and [32](#)).

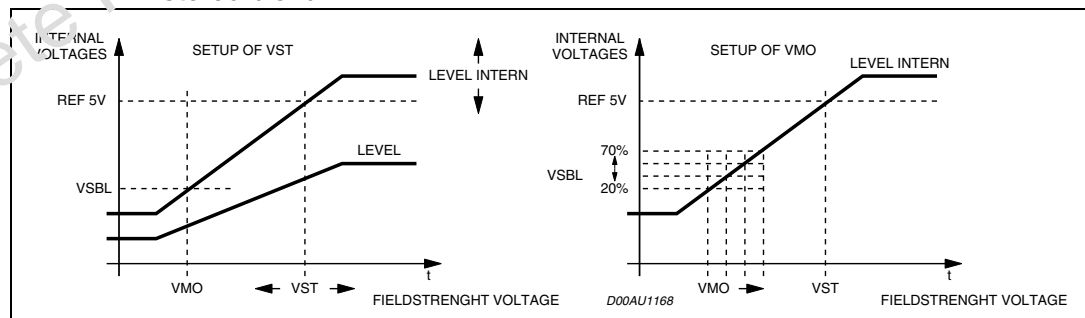

To adjust the external LEVEL voltage to the internal range two values must be defined: the LEVEL gain L_G and VSBL (see [Figure 32](#)). At the point of full channel separation the external level signal has to be amplified that internally it becomes equal to REF5V. The second point (e.g. 10dB channel sep.) is then adjusted with the VSBL voltage.

Figure 31. Internal stereo blend characteristics

The gain can be programmed through 4 bits in the "Stereo decoder adjustment" byte. All necessary internal reference voltages like REF5V are derived from a bandgap circuit. Therefore they have a temperature co-efficient near zero.

Figure 32. Relation between internal and external LEVEL voltages for setup of stereo blend

5.9 Highcut control

The highcut control set-up is similar to the stereo blend control set up: the starting point VHCH can be set with 2 bits to be 42, 50, 58 or 66% of REF5V whereas the range can be set to be 17, 22, 28 or 33% of VHCH (see [Figure 33](#)).

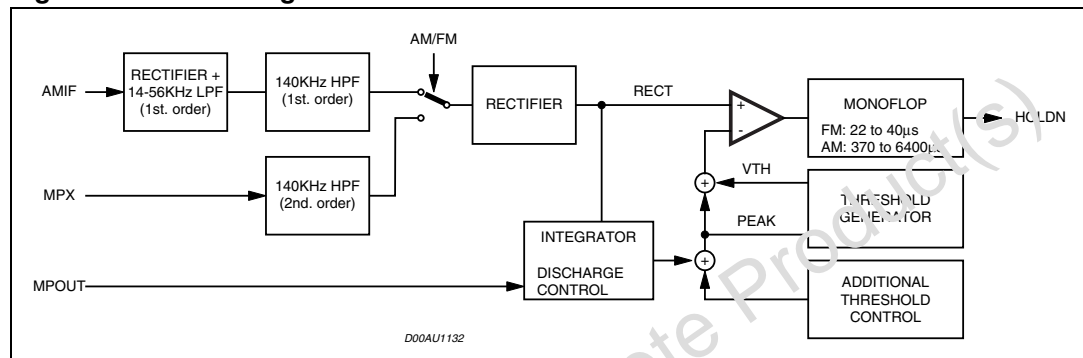

Figure 33. Highcut characteristics

6 Functional description of the noise blanker

In the automotive environment the MPX-signal as well as the AM signal is disturbed by spikes produced by the ignition and other radiating sources like the wiper motor. The aim of the noiseblanker part is to cancel the audible influence of the spikes. Therefore the output of the stereo decoder is held at the actual voltage for a time between 22 and 38 μ s in FM (370 and 645 μ s in AM mode). The block diagram of the noise blanker is given in [Figure 34](#).

Figure 34. Block diagram of the noise blanker

In a first stage the spikes must be detected but to avoid a wrong triggering on high frequency (white) noise a complex trigger control is implemented. Behind the trigger stage a pulse former generates the "blanking" pulse.

6.1 Trigger path FM

The incoming MPX signal is highpass-filtered, amplified and rectified. This second order highpass filter has a corner-frequency of 140kHz. The rectified signal, RECT, is integrated (lowpass filtered) to generate a signal called PEAK. The DC-charge/discharge behavior can be adjusted as well as the transient behavior (MP discharge control). Also noise with a frequency 140kHz increases the PEAK voltage. The PEAK voltage is fed to a threshold generator, which adds to the PEAK voltage a DC dependent threshold VTH. Both signals, RECT and PEAK+VTH are fed to a comparator which triggers a re-triggerable monoflop. The monoflop's output activates the sample and hold circuits in the signalpath for the selected duration.

6.2 Noise controlled threshold adjustment (NCT)

There are mainly two independent possibilities for programming the trigger threshold:

1. the low threshold in 8 steps (bits D₁ to D₃ of the noiseblanker byte I)
2. and the noise adjusted threshold in 4 steps (bits D₄ and D₅ of the noiseblanker byte I, see [Figure 21](#)).

The low threshold is active in combination with a good MPX signal without noise; the PEAK voltage is less than 1V. The sensitivity in this operation is high.

If the MPX signal is noisy (low fieldstrength) the PEAK voltage increases due to the higher noise, which is also rectified. With increasing of the PEAK voltage the trigger threshold increases, too. This gain is programmable in 4 steps (see [Figure 25](#)).

6.3 Additional threshold control mechanism

6.3.1 Automatic threshold control by the stereo blend voltage

Besides the noise controlled threshold adjustment there is an additional possibility for influencing the trigger threshold which depends on the stereo blend control.

The point where the MPX signal starts to become noisy is fixed by the RF part. Therefore also the starting point of the normal noise-controlled trigger adjustment is fixed ([Figure 27](#)). In some cases the behavior of the noiseblanker can be improved by increasing the threshold even in a region of higher fieldstrength. Sometimes a wrong triggering occurs for the MPX signal often shows distortion in this range which can be avoided even if using a low threshold. Because of the overlap of this range and the range of the stereo/mono transition it can be controlled by stereo blend. This increase of the threshold is programmable in 3 steps or switched off.

6.3.2 Over deviation detector

If the system is tuned to stations with a high deviation the noiseblanker can trigger on the higher frequencies of the modulation or distortion. To avoid this behavior, which causes audible noise in the output signal, the noiseblanker offers a deviation-dependent threshold adjustment. By rectifying the MPX signal a further signal representing the actual deviation is obtained. It is used to increase the PEAK voltage. Offset and gain of this circuit are programmable in 3 steps with the bits D_6 and D_7 of the noiseblanker byte I (bit combination '00' turns off the detector, see [Figure 26](#)).

6.3.3 Multipath level

To react on high repetitive spikes caused by a multipath-situation, the discharge time of the PEAK voltage can be decreased depending on the voltage-level at pin MPout. The TDA7402 offers a linear as well as a threshold driven control. The linear influence of the multipath level on the PEAK-signal (D_7 of multipath control byte) gives a discharge slew rate of $1V/ms^{(a)}$. The second possibility is to activate the threshold driven discharge which switches on the 18kOhm discharge if the multipath level is below 2.5V (D_7 of noiseblanker byte II byte).

6.3.4 AM mode of the noiseblanker

The TDA7402 noiseblanker is also suitable for AM noise cancelling. The detector uses in AM mode the 450kHz unfiltered IF output of the tuner for spike detection. A combination of programmable gain stage and lowpass filter forms an envelope detector which drives the noiseblanker's input via a 120kHz 1st order highpass. In order to blank the whole spike in AM mode the hold-times of the sample and hold circuit are much longer than in FM ($640\mu s$ to 1.2ms). All threshold controls can be used like in FM mode.

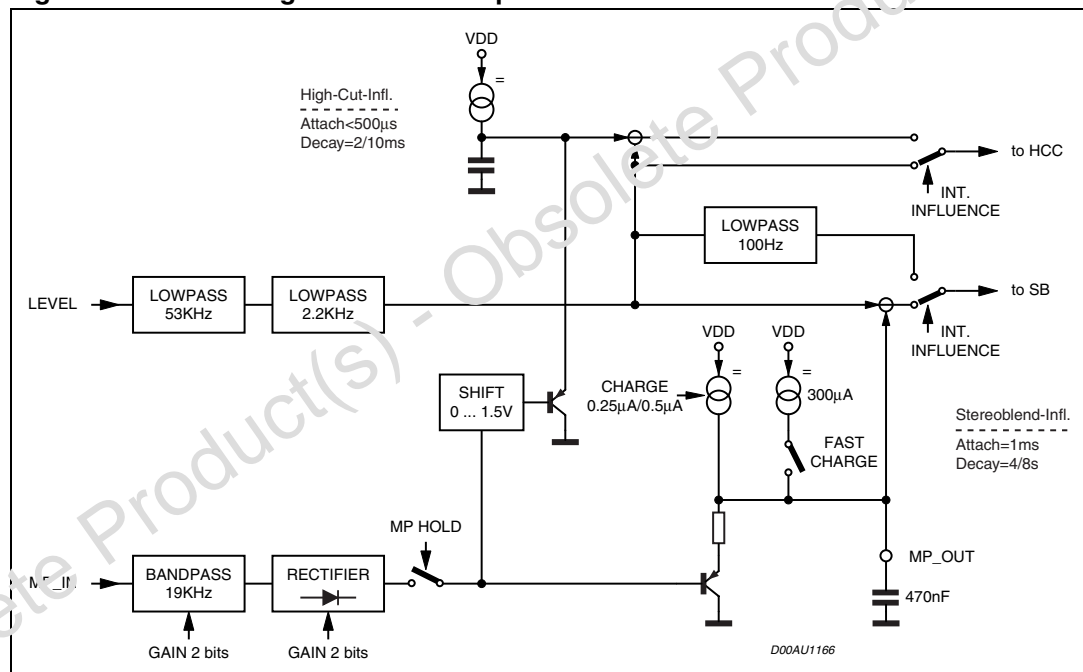

a. The serrate is measured with $R_{Discharge} = \infty$ and $V_{MPout} = 2.5 V$.

7 Functional description of the multipath detector

Using the multipath detector the audible effects of a multipath condition can be minimized. A multipath condition is detected by rectifying the spectrum around 19kHz in the fieldstrength signal. An external capacitor is used to define the attack and decay times for the stereo blend (see block diagram, [Figure 34](#)). Due to the very small charge currents this capacitor should be a low leakage current type (e.g ceramic). Using this configuration an adaptation to the user's requirement is possible without effecting the "normal" fieldstrength input (level) for the stereo decoder. This application is given in [Figure 34](#). Another (internal) time constant is used to control the Highcut through the multipath detector

Selecting the "internal influence" in the configuration byte the stereo-blend and/or the highcut is automatically invoked during a multipath condition according to the voltage appearing at the MP_OUT pin.

Figure 35. Block diagram of the multipath detector

7.1 Quality detector

The TDA7402 offers a quality detector output which gives a voltage representing the FM reception conditions. To calculate this voltage the MPX-noise and the multipath-detector output are summed according to the following formula:

$$V_{Qual} = 1.6 (V_{Noise} - 0.8 \text{ V}) + a (\text{REF5V} - V_{Mpbout}).$$

The noise-signal is the PEAK signal without additional influences (see the noiseblanker description). The factor 'a' can be programmed to 0.7 ... 1.15. The output is a low impedance output able to drive external circuitry as well as simply fed to an AD converter for RDS applications.

7.2 Testmode

During the testmode, which can be activated by setting bit D_0 and bit D_1 of the stereo decoder testing byte, several internal signals are available at the FD2R+ pin. During this mode the input resistance of 100kOhm is disconnected from the pin. The internal signals available are shown in the Data byte specification.

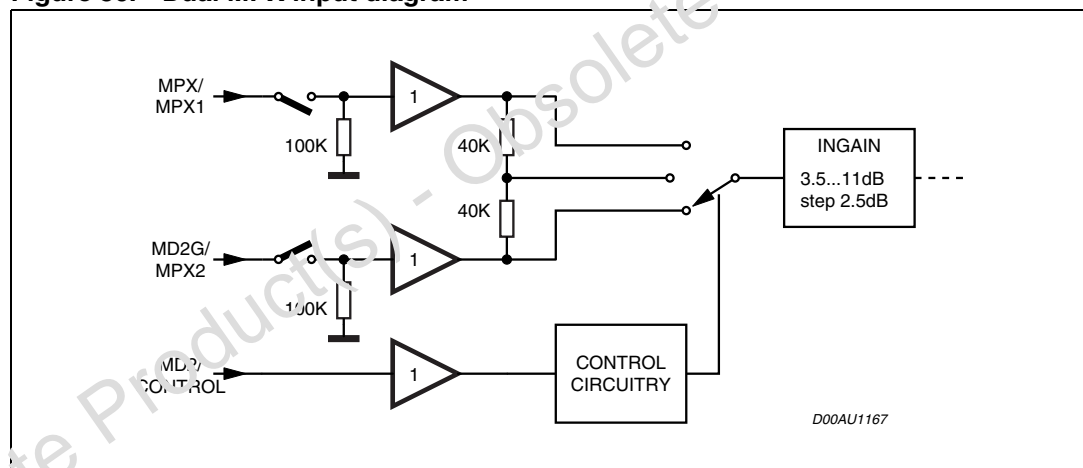

7.3 Dual MPX usage

7.3.1 Feature description

The TDA7402 is able to support a twin tuner concept via the Dual MPX Mode. In this configuration the MPX pin and the MD2G pin are acting as MPX1 and MPX2 inputs. The DC voltage at the MD2 pin controls whether one or both MPX signals are used to decode the stereo FM signal. It is designed as a window comparator with the characteristic shown in [Figure 3](#) (Please note that the thresholds have a hysteresis of 500mV).

In this mode the stereo decoder high ohmic-mute mutes both inputs in parallel.

Figure 36. Dual MPX input diagram

7.3.2 Configuration

The Dual MPX mode can be easily configured by setting bit 3 of subaddress 30 to LOW (see Byte 30 description and application diagram of [Figure 38](#)).

8 I²C bus interface

8.1 Interface protocol

- The interface protocol comprises:
- a start condition (S)
- a chip address byte (the LSB bit determines read / write transmission)
- a subaddress byte
- a sequence of data (N-bytes + acknowledge)
- a stop condition (P)

S = Start

R/W = "0" -> Receive-Mode (Chip could be programmed by μ P)

"1" -> Transmission-Mode (Data could be received by μ P)

ACK = Acknowledge

P = Stop

Max clock speed 500kbts/s

8.2 Auto increment

If bit I in the subaddress byte is set to "1", the auto increment of the subaddress is enabled.

8.3 Transmitted data (send mode)

Table 10. Transmitted data (send mode)

MSB						LSB	
X	X	X	X	X	P	ST	SM

SM = Soft mute activated

ST = Stereo

P = Pause

X = Not Used

The transmitted data is automatically updated after each ACK.

Transmission can be repeated without new chipaddress.

A Power-On-Reset is invoked if the Supply voltage is below than 3.5V. After that the following data is written automatically into the registers of all subaddresses:

Table 11. Reset condition

MSB							LSB
1	1	1	1	1	1	1	0

The programming after POR is marked bold-face / underlined in the programming tables. With this programming all the outputs are muted to V_{REF} ($V_{OUT} = V_{DD}/2$).

10 Package information

In order to meet environmental requirements, ST (also) offers these devices in ECOPACK® packages. ECOPACK® packages are lead-free. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label.

ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

11 Revision history

Table 39. Document revision history

Date	Revision	Changes
26-Apr-2002	1	Initial release
21-Jun-2004	2	Technical migration from ST-PRESS to EDOCS
26-Apr-2004	3	Revalidation
26-Apr-2006	4	Minor text changes.
23-Mar-2007	5	Document reformatted. Package change, text modifications.
18-Sep-2008	6	Content of the Table 18 , Table 19 and Table 24 reworked to improve readability, no technical changes.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
